Introduction

Branching networks are useful things:

- Fundamental to material supply and collection
- Supply: From one source to many sinks in 2- or 3-d.
- Collection: From many sources to one sink in 2- or 3-d.
- Typically observe hierarchical, recursive self-similar structure

Examples:

- River networks (our focus)
- Cardiovascular networks
- Plants
- Evolutionary trees
- Organizations (only in theory ...)

The sequential stages recognized in the evolution of a drainage system are "extension" and "integration"; the first, a stage of increasing complexity; the second, of simplification.

Definitions Allometry

♣ Hack's law (1957) [3]:

 $\ell \propto a^h$

reportedly 0.5 < h < 0.7

Scaling of main stream length with basin size:

 $\ell \propto L_{\parallel}^d$

reportedly 1.0 < d < 1.1

Basin allometry:

 $T_k = T_1 (R_T)^{k-1}$

 $\ell_{\omega+1}/\ell_{\omega} = R_{\ell}$

 $\bar{a}_{\omega+1}/\bar{a}_{\omega} = R_{\alpha}$

 $\bar{s}_{\omega+1}/\bar{s}_{\omega} = R_s$

 $L_{\perp} \sim L^{H}$

 $P(a) \sim a^{-\tau}$

 $P(\ell) \sim \ell^{-\gamma}$

 $\ell \sim a^h$

 $a \sim L^D$

There are a few more 'laws': [1]

Relation: Name or description:

Hack's law

Tokunaga's law

self-affinity of single channels

Horton's law of basin areas

scaling of basin widths

scaling of basin areas Langbein's law

probability of basin areas

variation of Langbein's law

probability of stream lengths

Horton's law of stream numbers

Horton's law of main stream lengths

Horton's law of stream segment lengths

$$L_{\parallel} \propto a^{h/d} \equiv a^{1/D}$$

 $D < 2 \rightarrow$ basins elongate.

Order of business:

Stream Ordering:

Kind of a mess ...

- 1. Find out how these relationships are connected.
- 2. Determine most fundamental description.
- 3. Explain origins of these parameter values

For (3): Many attempts: not yet sorted out ...

Introduction

Stream Ordering Horton's Laws Tokunaga's Law Nutshell

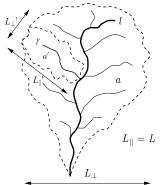

References

Stream Ordering:

Some definitions:

- A channel head is a point in landscape where flow becomes focused enough to form a stream.
- A source stream is defined as the stream that reaches from a channel head to a junction with another stream.
- Roughly analogous to capillary vessels.
- & Use symbol $\omega = 1, 2, 3, ...$ for stream order.

Basin allometry

Allometric relationships:

 $\ell \propto a^h$

 $\ell \propto L^d$

Combine above:

 $a \propto L^{d/h} \equiv L^D$

WW | •9 a (→ 17 of 54

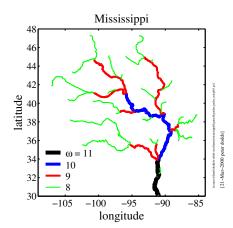

•9 q (№ 25 of 54

Stream Ordering:

- 1. Label all source streams as order $\omega = 1$ and remove.
- 2. Label all new source streams as order $\omega = 2$ and remove.
- 3. Repeat until one stream is left (order = Ω)
- 4. Basin is said to be of the order of the last stream removed.
- 5. Example above is a basin of order $\Omega = 3$.

Stream Ordering—A large example:

Stream Ordering:

Another way to define ordering:

- & As before, label all source streams as order $\omega = 1$.
- Follow all labelled streams downstream
- & Whenever two streams of the same order (ω) meet, the resulting stream has order incremented by 1 ($\omega + 1$).
- If streams of different orders ω_1 and ω_2 meet, then the resultant stream has order equal to the largest of the two.
- Simple rule:

where δ is the Kronecker delta.

Stream Ordering:

One problem:

- Resolution of data messes with ordering
- Micro-description changes (e.g., order of a basin may increase)
- ...but relationships based on ordering appear to be robust to resolution changes.

Utility:

- Stream ordering helpfully discretizes a network.
- Goal: understand network architecture

 $\bar{\ell}_{\omega+1}/\bar{\ell}_{\omega} = R_{\ell} > 1$

 $n_{\omega}/n_{\omega+1} = R_n > 1$

Horton's law of basin areas:

UVM

少 q (~ 35 of 54

•9 q (→ 28 of 54

WW | 少 Q (№ 31 of 54

Horton's laws

Horton's Ratios:

So ...laws are defined by three ratios:

$$R_n,\ R_\ell,\ {\rm and}\ R_a.$$

& Horton's laws describe exponential decay or

$$\begin{split} n_{\omega} &= n_{\omega-1}/R_n \\ &= n_{\omega-2}/R_n^{\ 2} \\ \vdots \\ &= n_1/R_n^{\ \omega-1} \\ &= n_1 e^{-(\omega-1)\ln R_n} \end{split}$$

Horton's laws

Similar story for area and length:

$$\bar{a}_{\omega} = \bar{a}_1 e^{(\omega-1) {\rm ln} R_a}$$

$$\bar{\ell}_{\omega} = \bar{\ell}_1 e^{(\omega - 1) \ln R_{\ell}}$$

& As stream order increases, number drops and area and length increase.

Horton's laws

A few more things:

- A Horton's laws are laws of averages.
- Averaging for number is across basins.
- Averaging for stream lengths and areas is within
- A Horton's ratios go a long way to defining a branching network ...
- & But we need one other piece of information ...

network structure [8, 9, 10]

connect to each other.

Delving deeper into network architecture:

& Tokunaga (1968) identified a clearer picture of

& As per Horton-Strahler, use stream ordering.

Recus: describe how streams of different orders.

•9 q (→ 38 of 54

III | •9 < ○ 41 of 54

Network Architecture

Definition:

- $Rac{1}{4}$ $Rac{1}{4}$ = the average number of side streams of order ν that enter as tributaries to streams of order μ
- & μ , ν = 1, 2, 3, ...
- $\& \mu > \nu + 1$
- & Recall each stream segment of order μ is 'generated' by two streams of order $\mu-1$
- These generating streams are not considered side streams.

Network Architecture

Tokunaga's law

Property 1: Scale independence—depends only on difference between orders:

$$T_{\mu,\nu} = T_{\mu-\nu}$$

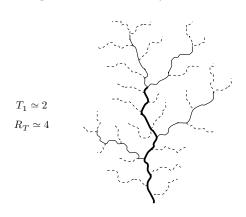

Property 2: Number of side streams grows exponentially with difference in orders:

$$T_{\mu,\nu} = T_1(R_T)^{\mu-\nu-1}$$

We usually write Tokunaga's law as:

$$\boxed{T_k = T_1(R_T)^{k-1}}$$
 where $R_T \simeq 2$

Tokunaga's law—an example:
