Variable Transformation

Understand power laws as arising from:

1. Elementary distributions (e.g., exponentials).
2. Variables connected by power relationships.

☞ Random variable X with known distribution P_x

☞ Second random variable Y with $y = f(x)$.

$$P_Y(y)dy = \sum_{x|f(x)=y} P_X(x)dx$$

$$= \sum_{y|f(x)=y} P_X(f^{-1}(y)) \frac{dy}{|f'(f^{-1}(y))|}$$

☞ Often easier to do by hand...

Now make transformation:

$$P_y(y)dy = P_x(x)dx$$

$$P_y(y)dy = P_x \left(\frac{y}{c} \right)^{-1/\alpha} \frac{c^{1/\alpha}}{\alpha} y^{-1-1/\alpha} dy$$

☞ If $P_x(x) \rightarrow$ non-zero constant as $x \rightarrow 0$ then

$$P_y(y) \propto y^{-1-1/\alpha} \text{ as } y \rightarrow \infty.$$

☞ If $P_x(x) \rightarrow x^\beta$ as $x \rightarrow 0$ then

$$P_y(y) \propto y^{-1-1/\alpha-\beta/\alpha} \text{ as } y \rightarrow \infty.$$

Example

Exponential distribution

Given $P_x(x) = \frac{1}{\lambda} e^{-x/\lambda}$ and $y = cx^{-\alpha}$, then

$$P(y) \propto y^{-1-1/\alpha} + O(y^{-1-2/\alpha})$$

- ☞ Exponentials arise from randomness (easy) ...
- ☞ More later when we cover robustness.

Example

- ☞ Assume relationship between x and y is 1-1.
- ☞ Power-law relationship between variables:
 $y = cx^{-\alpha}, \alpha > 0$
- ☞ Look at y large and x small

$$dy = d(cx^{-\alpha})$$

$$= c(-\alpha)x^{-\alpha-1}dx$$

$$\text{invert: } dx = \frac{-1}{c\alpha} x^{\alpha+1} dy$$

$$dx = \frac{-1}{c\alpha} \left(\frac{y}{c} \right)^{-(\alpha+1)/\alpha} dy$$

$$dx = \frac{-c^{1/\alpha}}{\alpha} y^{-1-1/\alpha} dy$$

Gravity

- ☞ Select a random point in the universe \vec{x} .
- ☞ Measure the force of gravity $F(\vec{x})$.
- ☞ Observe that $P_F(F) \sim F^{-5/2}$.
- ☞ Distribution named after Holtsmark who was thinking about electrostatics and plasma [1].
- ☞ Again, the humans naming things after humans, poorly.¹

Gravity:

Matter is concentrated in stars: [2]

- F is distributed unevenly
- Probability of being a distance r from a single star at $\vec{x} = \vec{0}$:

$$P_r(r)dr \propto r^2 dr$$

- Assume stars are distributed randomly in space (oops?)
- Assume only one star has significant effect at \vec{x} .
- Law of gravity:

$$F \propto r^{-2}$$

- invert:

$$r \propto F^{-\frac{1}{2}}$$

- Connect differentials: $dr \propto dF^{-\frac{1}{2}} \propto F^{-\frac{3}{2}} dF$

$$P_F(F) = F^{-5/2} dF$$

$$\gamma = 5/2$$

- Mean is finite.
- Variance = ∞ .
- A wild distribution.
- Upshot: Random sampling of space usually safe but can end badly...

Extreme Caution!

- PLIPLO = **Power law in, power law out**
- Explain a power law as resulting from another unexplained power law.
- Yet another homunculus argument [↗](#)...
- Don't do this!!! (slap, slap)
- MIWO = **Mild in, Wild out** is the stuff.
- In general: We need mechanisms!

Transformation:

Using $r \propto F^{-1/2}$, $dr \propto F^{-3/2} dF$, and $P_r(r) \propto r^2$

$$P_F(F)dF = P_r(r)dr$$

$$\propto P_r(\text{const} \times F^{-1/2})F^{-3/2}dF$$

$$\propto (F^{-1/2})^2 F^{-3/2}dF$$

$$= F^{-1-3/2}dF$$

$$= F^{-5/2}dF.$$

□ Todo: Build Dalek army.
