FIG. 1 (color online). (a) Schematic representation of the weighted game tree of chess based on the SCIDBASE [6] for the first three half moves. Each node indicates a state of the game. Possible game continuations are shown as solid lines together with the branching ratios r_{μ} . Dotted lines symbolize other game continuations, which are not shown. (b) Alternative representation emphasizing the successive segmentation of the set of games, here indicated for games following a 1.44 opening until the fourth half move d = 4. Each node σ is represented by a box of a size proportional to its frequency n_{σ} . In the subsequent half move these games split into subsets (indicated vertically below) according to the possible game continuations. Highlighted in (a) and (b) is a popular opening sequence 1.44 Nf6 2.c4 c6 (Indian defense.)

v

FIG. 2 (color online). (a) Histogram of weight frequencies S(n) of openings up to d = 40 in the Sci database and with logarithmic binning. A straight line fit (not shown) yields an exponent of $\alpha = 2.05$ with a goodness of fit $R^2 > 0.9992$. For comparison, the Zipf distribution Eq. (8) with $\mu = 1$ is indicated as a solid line. Inset: number $C(n) = \sum_{m=n+1}^{N} S(m)$ of openings with a popularity m > n. C(n) follows a power law with exponent $\alpha = 1.04$ ($R^2 = 0.994$). (b) Number $S_d(n)$ of openings of epth d with a given popularity n for d = 16 and histograms with logarithmic binning for d = 4, d = 16, and d = 22. Solid lines are regression lines to the logarithmically binned data $R^2 > 0.99$ for d < 35). Inset: slope α_d of the regression line as a function of d and $\beta = 0$ solid line).

Our Intuition

Definition

Examples

Wild vs. Mild

CCDFs

Size rankings and Zipf's law

Size ranking ⇔ CCDF

- $NP_{\geq}(x) = \text{the number of objects with size at least } x$ where N = total number of objects.
- \mathfrak{s} If an object has size x_r , then $NP_{\geq}(x_r)$ is its rank r.
- 💑 So

$$x_r \propto r^{-\alpha} = (NP_{\geq}(x_r))^{-\alpha}$$

The PoCSverse Power-Law Size Distributions 71 of 80

Our Intuition

Definition

Examples

Wild vs. Mild

CCDFs

Size rankings and Zipf's law

Size ranking ⇔ CCDF

- $NP_{\geq}(x) = \text{the number of objects with size at least } x$ where N = total number of objects.
- \mathfrak{s} If an object has size x_r , then $NP_{\geq}(x_r)$ is its rank r.

👶 So

 $x_r \propto r^{-\alpha} = (NP_>(x_r))^{-\alpha}$

$$\propto x_r^{-(\gamma-1)(-lpha)}$$
 since $P_{\geq}(x) \sim x^{-(\gamma-1)}$.

The PoCSverse Power-Law Size Distributions 71 of 80

Our Intuition

Definition

Examples

Wild vs. Mild

CCDFs

Size rankings and Zipf's law

Size ranking ⇔ CCDF

So So

- \mathfrak{s} If an object has size x_r , then $NP_{\geq}(x_r)$ is its rank r.

 $x_r \propto r^{-\alpha} = (NP_>(x_r))^{-\alpha}$

$$\propto x_r^{-(\gamma-1)(-lpha)}$$
 since $P_\geq(x)\sim x^{-(\gamma-1)}.$

We therefore have $1 = -(\gamma - 1)(-\alpha)$ or:

$$\alpha = \frac{1}{\gamma - 1}$$

The PoCSverse Power-Law Size Distributions 71 of 80

Our Intuition

Definition

Examples

Wild vs. Mild

CCDFs

Size rankings and Zipf's law

Size ranking ⇔ CCDF

So So

- \mathfrak{s} If an object has size x_r , then $NP_{\geq}(x_r)$ is its rank r.

$$x_r \propto r^{-\alpha} = (NP_{\geq}(x_r))^{-\alpha}$$

$$\propto x_r^{-(\gamma-1)(-lpha)}$$
 since $P_{\geq}(x) \sim x^{-(\gamma-1)}$.

We therefore have $1 = -(\gamma - 1)(-\alpha)$ or:

 $\alpha = \frac{1}{\gamma - 1}$

A rank distribution exponent of $\alpha = 1$ corresponds to a size distribution exponent $\gamma = 2$.

CCDFs

Size rankings and Zipf's law

Size ranking ⇔ CCDF

Nutshell for power-law size distributions and size-rank orderings:

- 🚳 Heavy-tailed distributions abound.
- 🚳 Some are power-law size distributions.
- $\ref{eq: continuous: } P(x) \sim x^{-\gamma},$ discrete: $P(k) \sim ck^{-\gamma}$
- $\ref{eq: starting of the star$
- \bigotimes Mean depends on lower cutoff if $\gamma > 2$.
- $ightarrow \gamma < 2$: Typical sample is large.
- $ightarrow \gamma > 2$: Typical sample is small.
- $\label{eq:Complementary Cumulative Distribution Function} (CCDF): P(x) \propto x^{-(\gamma-1)} \text{ and } P_\geq(k) = k^{-(\gamma-1)}$

 $\ref{eq:size}$ Size of largest sample from n samples grows as:

 $x_1\gtrsim c'n^{1/(\gamma-1)}$

CCDFs

Size rankings and Zipf's law

Size ranking ⇔ CCDF

More with the nutshelling:

Size rankings: Order types from "biggest" to "smallest" size S.
 Widely observed: S_r is highly skewed.
 When scaling is apparent:

$$S_r \propto r^{-\alpha}$$

 \mathfrak{S} Claim: α often close to 1. "Zipf's law":

 $S_r \propto r^{-1}$.

Scalings of size distribution (γ) and size ranking (α) are connected:

$$\alpha = \frac{1}{\gamma - 1}$$
 and $\gamma = 1 + \frac{1}{\alpha}$.

Danger Will Robinson point: $\gamma = 2 \Leftrightarrow \alpha = 1$.
