The PoCSverse Scaling 7 of 124 Allometry Biology Physics People Money Language Technology Specialization

Scalingarama

General observation:

Systems (complex or not) that cross many spatial and temporal scales often exhibit some form of scaling.

Outline—All about scaling:

Basic definitions. Examples.

Possibly later:

- Advances in measuring your power-law relationships.
 - Scaling in blood and river networks.
- A The Unsolved Allometry Theoricides.

The PoCSverse Scaling 8 of 124 Scaling-at-large Biology People

Language

Technology

Specialization

Definitions

A power law relates two variables x and y as follows:

$$y = cx^{o}$$

α is the scaling exponent (or just exponent)
 α can be any number in principle but we will find various restrictions.

 \mathfrak{E} c is the prefactor (which can be important!)

References

The PoCSverse

Scaling 9 of 124 Scaling-at-large

Biology Physics

People Money Language Technology Specialization

Definitions

The prefactor *c* must balance dimensions.

Imagine the height ℓ and volume v of a family of shapes are related as:

$$\ell = cv^{1/4}$$

Using $[\cdot]$ to indicate dimension, then

$$[c] = [\ell]/[v^{1/4}] = L/L^{3/4} = L^{1/4}.$$

 \bigotimes More on this later with the Buckingham π theorem.

The PoCSverse Scaling 10 of 124 Scaling-at-large Biology Physics People Money Language Technology

Specialization

Looking at data

🛞 Power-law relationships are linear in log-log space:

 $y = cx^{\alpha}$

 $\Rightarrow \log_{h} y = \alpha \log_{h} x + \log_{h} c$

with slope equal to α , the scaling exponent.

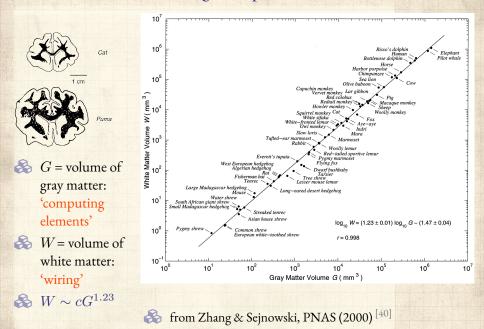

- Much searching for straight lines on log-log or double-logarithmic plots.
- Good practice: Always, always, always use base 10. \lambda Yes, the Dozenalists 🗹 are right, 12 would be better.
- But: hands.¹And social pressure.
- 🔗 Talk only about orders of magnitude (powers of 10).

The PoCSverse Scaling 11 of 124 Scaling-at-large Biology Physics People Money Language Specialization References

¹Probably an accident of evolution—debated.

A beautiful, heart-warming example:

Why is $\alpha \simeq 1.23$?

Quantities (following Zhang and Sejnowski):

- G =Volume of gray matter (cortex/processors)
- & W =Volume of white matter (wiring)
- rightarrow T = Cortical thickness (wiring)
- S = Cortical surface area
- & L = Average length of white matter fibers
- $\bigotimes p$ = density of axons on white matter/cortex interface

A rough understanding:

 $\begin{array}{l} \displaystyle \bigotimes \quad G \sim ST (\text{convolutions are okay}) \\ \displaystyle \bigotimes \quad W \sim \frac{1}{2} p SL \\ \displaystyle \bigotimes \quad G \sim L^3 \\ \displaystyle \bigotimes \quad \text{Eliminate } S \text{ and } L \text{ to find } W \propto G^{4/3}/T \end{array}$

The PoCSverse Scaling 13 of 124 Scaling-at-large Biology Physics People Money Language Technology Specialization References

Why is $\alpha \simeq 1.23$?

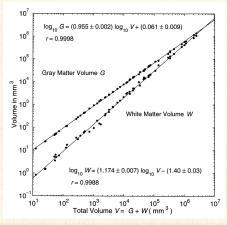

A rough understanding:

 $\begin{cases} & \text{We are here: } W \propto G^{4/3}/T \\ & \text{Observe weak scaling } T \propto G^{0.10\pm0.02}. \\ & \text{Observe weak scaling } T \propto G^{0.9} \rightarrow \text{convolutions fill space.} \\ & \text{Observe weak scaling } T \propto G^{1.23\pm0.02} \end{cases}$

The PoCSverse Scaling 14 of 124 Scaling-at-large Biology Physics People Money Language Technology Specialization References

Tricksiness:

The PoCSverse Scaling 15 of 124 Scaling-at-large Biology Physics People Money Language Technology Specialization References

With V = G + W, some power laws must be approximations. Reasuring exponents is a hairy business...

Disappointing deviations from scaling:

Per George Carlin 🗹

Image from here

The koala \mathbb{C}^{n} , a few roos short in the top paddock:

- Solution Very small brains C relative to body size.
- \lambda Wrinkle-free, smooth.
- 🗞 Not many algorithms needed:
 - Only eat eucalyptus leaves (no water)
 - (Will not eat leaves picked and presented to them)
 - Move to the next tree.
 - Sleep.
 - Defend themselves if needed (tree-climbing crocodiles, humans).
 - Occasionally make more koalas.

Scaling 16 of 124 Scaling-at-large Biology Physics People Money Language Technology Specialization References

The PoCSverse

Good scaling:

General rules of thumb:

High quality: scaling persists over three or more orders of magnitude for each variable.

Medium quality: scaling persists over three or more orders of magnitude for only one variable and at least one for the other.

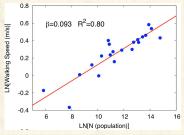

Very dubious: scaling 'persists' over less than an order of magnitude for both variables.

The PoCSverse Scaling 17 of 124 Scaling-at-large Biology Physics People Money Language Technology Specialization References

Unconvincing scaling:

Average walking speed as a function of city population:

Two problems:

- 1. use of natural log, and
- 2. minute varation in dependent variable.

The PoCSverse Scaling 18 of 124 Scaling actarge Allometry Biology Physics Physics People Money Language Technology

Specialization References

from Bettencourt et al. (2007)^[4]; otherwise totally great—more later.

Definitions

Power laws are the signature of scale invariance:

Scale invariant 'objects' look the 'same' when they are appropriately rescaled.

Objects = geometric shapes, time series, functions, relationships, distributions,...

Same' might be 'statistically the same'

To rescale means to change the units of measurement for the relevant variables

The PoCSverse Scaling 19 of 124 Scaling-at-large Allometry Biology Physics

Scale invariance

2

3

Our friend $y = cx^{\alpha}$:

 $\label{eq:generalized} \begin{array}{l} & \& \\ \& \end{array} \mbox{ If we rescale x as $x=rx'$ and y as $y=r^{\alpha}y'$,} \\ & \& \\ & \& \\ & r^{\alpha}y'=c(rx')^{\alpha} \end{array}$

$$\Rightarrow u' = cr^{\alpha} x'^{\alpha} r^{-\alpha}$$

$$\Rightarrow y' = cx'^{\alpha}$$

Scale invariance

Compare with $y = ce^{-\lambda x}$:

 \clubsuit If we rescale x as x = rx', then

$$y = ce^{-\lambda rx}$$

Original form cannot be recovered.
Scale matters for the exponential.

More on $y = ce^{-\lambda x}$:

Say
$$x_0 = 1/\lambda$$
 is the characteristic scale
For $x \gg x_0$, y is small,
while for $x \ll x_0$, y is large.

Specialization

Definitions

Isometry versus Allometry:

Iso-metry = 'same measure'
 Allo-metry = 'other measure'

We use allometric scaling to refer to both:

- 1. Nonlinear scaling of a dependent variable on an independent one (e.g., $y \propto x^{1/3}$)
- 2. The relative scaling of correlated measures (e.g., white and gray matter).

 \mathcal{R} Variable dimensions: $[\ell] = L, [m] = M, [g] = LT^{-2}$, and $[\tau] = T.$

 \mathfrak{F} Turn over your envelopes and find some π 's.

19

A little formalism:

Game: find all possible independent combinations of the $\{q_1, q_2, \ldots, q_n\}$, that form dimensionless quantities $\{\pi_1, \pi_2, \ldots, \pi_p\}$, where we need to figure out p (which must be $\leq n$).

So Consider
$$\pi_i = q_1^{x_1} q_2^{x_2} \cdots q_n^{x_n}$$

- We (desperately) want to find all sets of powers x_j that create dimensionless quantities.
- $\label{eq:definition} \textstyle \& \ \ \, \text{Dimensions: want} \, [\pi_i] = [q_1]^{x_1} [q_2]^{x_2} \cdots [q_n]^{x_n} = 1.$

For the platypus pendulum we have

$$[q_1] = L, [q_2] = M, [q_3] = LT^{-2}, \text{ and } [q_4] = T,$$

with dimensions $d_1 = L$, $d_2 = M$, and $d_3 = T$.

We regroup:
$$[\pi_i] = L^{x_1 + x_3} M^{x_2} T^{-2x_3 + x_4}.$$

- - Time for matrixology ...

Well, of course there are matrices:

🚳 Thrillingly, we have:

$$\mathbf{A}\vec{x} = \begin{bmatrix} 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -2 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

 \mathbf{R} A nullspace equation: $\mathbf{A}\vec{x} = \vec{0}$.

- Number of dimensionless parameters = Dimension of null space = n r where *n* is the number of columns of **A** and *r* is the rank of **A**.
- \mathfrak{R} Here: n = 4 and $r = 3 \rightarrow F(\pi_1) = 0 \rightarrow \pi_1$ = const.
- In general: Create a matrix A where *ij*th entry is the power of dimension *i* in the *j*th variable, and solve by row reduction to find basis null vectors.

& We (you) find: $\pi_1 = \ell/g\tau^2 = \text{const.}$ Upshot: $\tau \propto \sqrt{\ell}$.

Non-simple scaling for death:

"Statistical signs of social influence on suicides" Melo et al., Scientific Reports, 4, 6239, 2014. ^[27]

- Bettencourt *et al.*'s initial work suggested social phenomena would follow superlinear scaling (wealth, crime, disease)
- Homicide, traffic, and suicide ^[10] all tied to social context in complex, different ways.

- Homicide appears to follow superlinear scaling $(\beta = 1.24 \pm 0.01)$
- Traffic accident deaths appear to follow linear scaling $(\beta = 0.99 \pm 0.02)$

 \bigcirc Suicide appears to follow sublinear scaling. ($\beta = 0.84 \pm 0.02$)

TABLE 1 Summary of results*

A key framing from language:

Types and Tokens:

- In linguistics, words are described on the two levels of types and tokens [32].
- In semiotics, signs can be thought of having two components of the signified and the signifier C.

Example:

- Types are 1-grams C, e.g., '!', 'the', 'love', and 'spork'.
- 🚳 Tokens are 1-grams as written down.
- In "Pride and Prejudice", for example, there are 498 '!'s, 4,058 'the's, 90 'love's, and 0 'spork's.

Types and Things and Measures, Oh My!

Beyond language:

Lift out and expand the type-token framing to complex systems in general.

Three Four possible parts:

- 1. Type: A kind or class of category of individual things based on shared characteristics.
- 2. Thing: An individual manifestation of a type.
- 3. Measure: A quantification of the manifestation of things.
- 4. Experience: An interaction of any kind with a manifestation of a type.⁹

Specialization

Language:

- 1. Type: A defined word.
- 2. Thing (token): An instance of spoken or printed word.
- 3. Number or Frequency (counts of tokens).
- 4. Experience: Listening to others, reading a book.

Atoms:

- 1. Type: Atom
- 2. Thing: Element (stuff made of a given atom; e.g., gold)
- 3. Measure: Mass; could be Number.
- 4. Experience: Atomic bonds.

Specialization

Water:

- 1. Type: Water molecule, H^2O .
- 2. Thing: Water.
- 3. Measure: Volume (liters, gallons); given pressure and temperature, equivalent to Number (counts of molecules) and then Mass.
- 4. Experience: Rain.

Biology:

- Example type: The species Ornithorhynchus anatinus, the platypus.
- 🚳 Thing: Any given platypus.
 - Measure: The number of platypuses ('instances' of the species) living in Australia in the wild.
- Experience: Seeing a platypus in the wild; being hunted by a platypus.

Specialization

Moneyspace:

- 😤 Example type: Corporation.
- Things: The publicly traded companies of Apple and Microsoft.
- 🙈 Measure: Market capitalization.
 - Experience: Being sued by Microsoft.
- Apple and Microsoft may be viewed as components of the publicly-owned corporate world.
- The sizes of corporations may be broken down into many rankable dimensions such as annual revenue or number of employees worldwide.
- In principle, market capitalization represents a kind of current collective belief in terms of money.

Sizes and Rankings:

- We will often consider systems where each component type τ has at least one measurable—and hence rankable—'size' s_{τ} .
- Perceived size is a combination of Measure (what exists) and Experience (what is measured).
- Solution Important: We may also have rankings where we do not know the underlying 'size' (e.g., book/thing sales on Amazon).

Three examples which show some of the range of what 'size' can mean:

- Size for a word in a corpus means the number of indistinguishable instances of that word (many identical entites—tokens);
- 2. Size for species means the number of 'biological replications' of an individual type (many genetically similar entities of varying ages); and
- 3. Size for a corporation might mean monetary value (market cap, one entity).
- 4. May have more than one measure of a system:
 - Total biomass of a species.¹⁰
 - Number of employees in a corporation.
 - Number of stars in a galaxy.¹⁰
- 5. Measure of size allows for rankings.
- 6. Again, sizes may be hidden.

¹⁰Somewhat hard to estimate.

When tokens are fungible:

- Randomly permute all of the words (tokens) of the same type in Pride and Prejudice.
- 🚳 Measure and Experience will be unchanged.
- 🚳 NFTs: Non-fungible tokens.
- nto thinking tokens are types.
- 🛞 "The Oxymoron for Morons."

When tokens are funguses:

- NFF: Non-fungible fungus (from a sentient fungus's point of view).
- 🛞 But in cooking, funguses are fungible.
- \clubsuit Lack of exposure \square leads to fungibility of "the other."¹¹

¹¹Universal: Identical twins look the same until they don't.

Shell of the nut:

- ling is a fundamental feature of complex systems.
- 🗞 Basic distinction between isometric and allometric scaling.
- 🗞 Powerful envelope-based approach: Dimensional analysis.
- So "Oh yeah, well that's just dimensional analysis" said the [insert your own adjective] physicist.
- Tricksiness: A wide variety of mechanisms give rise to scalings.¹²
- Some mechanisms are common, some are rare.¹³

¹²It's not your great-great-great-grandparents' normal distribution
 ¹³To be understood: The scaling story of scaling-making mechanisms
