### Law and Order, Special Science Edition: Truthicide Department

"In the scientific integrity system known as peer review, the people are represented by two highly overlapping yet equally important groups: the independent scientists who review papers and the scientists who punish those who publish garbage. This is one of their stories."

#### What one might expect: Optimal Supply Networks II 4 of 122

Metabolism and Truthicide

Measuring exponents

River networks

Earlier theories

References

### $\alpha = 2/3$ because ...

Dimensional analysis suggests an energy balance surface law:

$$P \propto S \propto V^{2/3} \propto M^{2/3}$$

Assumes isometric scaling (not quite the spherical cow).

& Lognormal fluctuations:

Gaussian fluctuations in  $\log_{10} P$  around  $\log_{10} cM^{\alpha}$ .

& Stefan-Boltzmann law of for radiated energy:

$$\frac{\mathrm{d}E}{\mathrm{d}t} = \sigma \varepsilon S T^4 \propto S$$

### The prevailing belief of the Church of Quarterology:

 $\alpha = 3/4$ 

 $P \propto M^{3/4}$ 

Huh?

### Stories—The Fraction Assassin:

#### Optimal Supply Networks II

Metabolism and Truthicide

Death by fractions Measuring exponent

River networks

Geometric argument

### $P = c M^{\alpha}$

#### Prefactor c depends on body plan and body temperature:

Birds	39–41 $^{\circ}C$
Eutherian Mammals	36 – 38 ° C
Marsupials	$34 - 36 {}^{\circ}C$
Monotremes	$30-31^{\circ}C$

### The prevailing belief of the Church of Quarterology:

Death by fractions Measuring exponents

River networks Geometric argument

Optimal Supply Networks II

Metabolism and

Truthicide

References

Most obvious concern:

3/4 - 2/3 = 1/12

An exponent higher than 2/3 points suggests a fundamental inefficiency in biology.

Organisms must somehow be running 'hotter' than they need to balance heat loss.

#### From earlier in PoCS:

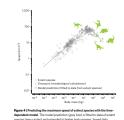

"How fast do living organisms move: Maximum speeds from bacteria to elephants and whales" Meyer-Vernet and Rospars,

American Journal of Physics, 83, 719-722, 2015. [35]

### Theoretical story:

- Maximum speed increases with size:  $v_{\text{max}} = aM^b$
- Takes a while to get going:  $v(t) = v_{\text{max}}(1 - e^{-kt})$
- $\& k \sim F_{\text{max}}/M \sim cM^{d-1}$ Literature:  $0.75 \lesssim d \lesssim 0.94$
- Acceleration time = depletion time for anaerobic energy:  $\tau \sim f M^g$ Literature:  $0.76 \lesssim q \lesssim 1.27$
- $\label{eq:vmax} \& v_{\rm max} = a M^b \left(1 e^{-h M^i}\right)$
- i = d 1 + g and h = cf
- Literature search for for maximum speeds of running, flying and swimming animals.
- Search terms: "maximum speed", "escape speed" and "sprint speed".

Note: [35] not cited.

# Theory meets a different 'truth':

Metabolism and Truthicide

Optimal Supply Networks II

### Measuring exponents

### More on regression:

If (a) we don't know what the errors of either variable are, or (b) no variable can be considered independent,

then we need to use

Standardized Major Axis Linear Regression. [43, 41]

(aka Reduced Major Axis = RMA.)

Optimal Supply Networks II Metabolism and Truthicide

Death by fractions

Measuring exponents

Earlier theorie Geometric argument

### Measuring exponents

### For Standardized Major Axis Linear Regression:

$$slope_{sma} = \frac{standard\ deviation\ of\ y\ data}{standard\ deviation\ of\ x\ data}$$

- Wery simple!
- Minimization of sum of areas of triangles induced by vertical and horizontal residuals with best fit line.
- Attributed to Nobel Laureate economist Paul Samuelson , [43] but discovered independently by others.
- #somuchwin

### Heusner's data, 1991 (391 Mammals)

range of $M$	N	$\hat{lpha}$
≤ 0.1 kg	167	$0.678 \pm 0.038$
$\leq 1 \text{ kg}$	276	$0.662 \pm 0.032$
$\leq 10\mathrm{kg}$	357	$0.668 \pm 0.019$
$\leq 25  \mathrm{kg}$	366	$0.669 \pm 0.018$
$\leq 35  \mathrm{kg}$	371	$0.675 \pm 0.018$
$\leq 350\mathrm{kg}$	389	$0.706 \pm 0.016$
$\leq 3670\mathrm{kg}$	391	$0.710 \pm 0.021$

# Measuring exponents

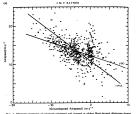

### Relationship to ordinary least squares regression is simple:

$$\begin{aligned} \mathsf{slope}_{_{\mathrm{SMA}}} &= r^{-1} \times \mathsf{slope}_{_{\mathrm{OLS}\,y\,\mathrm{on}\,x}} \\ &= r \times \mathsf{slope}_{_{\mathrm{OLS}\,x\,\mathrm{on}\,y}} \end{aligned}$$

where r = standard correlation coefficient:

$$r = \frac{\sum_{i=1}^{n}(x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^{n}(x_i - \bar{x})^2}\sqrt{\sum_{i=1}^{n}(y_i - \bar{y})^2}}$$

Groovy upshot: If (1) a paper uses OLS regression when RMA would be appropriate, and (2) r is reported, we can figure out the RMA slope. [41, 29]

### Analysis of residuals

- 1. Presume an exponent of your choice: 2/3 or 3/4.
- 2. Fit the prefactor  $(\log_{10} c)$  and then examine the residuals:

$$r_i = \log_{10} B_i - (\alpha' \log_{10} M_i - \log_{10} c).$$

- 3.  $H_0$ : residuals are uncorrelated  $H_1$ : residuals are correlated.
- 4. Measure the correlations in the residuals and compute a p-value.

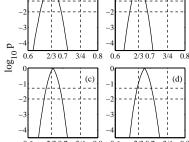

# Optimal Supply Networks II

39 of 122

### Death by fractions

Measuring exponents

Geometric argumer

Analysis of residuals—mammals

- (a) M < 3.2 kg,
- (b) M < 10 kg, (c) M < 32 kg,
- (d) all mammals.

# Impure scaling?:

regime

So: The exponent  $\alpha = 2/3$  works for all birds and mammals

♣ For mammals > 10-30 kg, maybe we have a new scaling

Possible connection?: Economos (1983)—limb length break in scaling around 20 kg [15]

But see later: non-isometric growth leads to lower metabolic scaling. Oops.

# Optimal Supply Networks II

45 of 122 Metabolism and

Death by fractions

Measuring exponents

River networks

Geometric argument

#### 2/3 0.7 3/4 0.8 0.6 2/3 0.7 3/4 0.8 α'

### Analysis of residuals

We use the spiffing Spearman Rank-Order Correlation Coefficient 2

#### Basic idea:

- $\mathfrak{S}$  Given  $\{(x_i, y_i)\}$ , rank the  $\{x_i\}$  and  $\{y_i\}$  separately from smallest to largest. Call these ranks  $R_i$  and  $S_i$ .
- Now calculate correlation coefficient for ranks,  $r_{\circ}$ :

8

$$r_s = \frac{\sum_{i=1}^n (R_i - \bar{R})(S_i - \bar{S})}{\sqrt{\sum_{i=1}^n (R_i - \bar{R})^2} \sqrt{\sum_{i=1}^n (S_i - \bar{S})^2}}$$

 $\mathbb{R}$  Perfect correlation:  $x_i$ 's and  $y_i$ 's both increase monotonically.

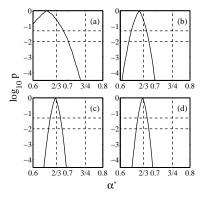

#### Optimal Supply Networks II 40 of 122 Metabolism and

Truthicide Death by fractions

# Measuring exponent

Geometric argumer

# Analysis of residuals—birds

- (a) M < 0.1 kg,
- (b)  $M < 1 \,\text{kg}$ , (c) M < 10 kg,

### (d) all birds.

## Nutrient delivering networks:

### West et al.'s assumptions:

- 1. hierarchical network
- 2. capillaries (delivery units) invariant
- 3. network impedance is minimized via evolution

#### Claims:

- $P \propto M^{3/4}$
- networks are fractal
- a quarter powers everywhere

Optimal Supply Networks II

Metabolism and Truthicide

Death by fraction

Measuring exponent

Earlier theories

### Impedance measures:

Poiseuille flow (outer branches):

$$Z = \frac{8\mu}{\pi} \sum_{k=0}^N \frac{\ell_k}{r_k^4 N_k}$$

Pulsatile flow (main branches):

$$Z \propto \sum_{k=0}^N \frac{h_k^{1/2}}{r_k^{5/2} N_k}$$

- Wheel out Lagrange multipliers ...
- Pulsatile calculation explodes into flames.

### Not so fast ...

- $P \propto M^{3/4}$  does not follow for pulsatile flow
- networks are not necessarily fractal.

Murray's cube law (1927) for outer branches: [37]

$$r_0^3 = r_1^3 + r_2^3$$

- Can still assume networks are fractal.

### Let's never talk about this again:

"The fourth dimension of life: Fractal geometry and allometric scaling of organisms"

West, Brown, and Enquist, Science, **284**, 1677–1679, 1999. [54]

- No networks: Scaling argument for energy exchange area a.
- Distinguish between biological and physical length scales (distance between mitochondria versus cell radius).
- $\mathfrak{S}$  Buckingham  $\pi$  action. [9]
- Arrive at  $a \propto M^{D/D+1}$  and  $\ell \propto M^{1/D}$ .
- New disaster: after going on about fractality of a, then state  $v \propto a\ell$  in general.

#### Actually, model shows:

#### Do find:

- Impedance is distributed evenly.

West, Brown, and Enquist,

## Connecting network structure to $\alpha$

1. Ratios of network parameters:

$$R_n = \frac{n_{k+1}}{n_{l\cdot}}, \; R_\ell = \frac{\ell_{k+1}}{\ell_{l\cdot}}, \; R_r = \frac{r_{k+1}}{r_{l\cdot}}$$

Note:  $R_{\ell}$ ,  $R_{r} < 1$ , inverse of stream ordering definition.

2. Number of capillaries  $\propto P \propto M^{\alpha}$ .

$$\Rightarrow \boxed{\alpha = -\frac{\ln\!R_n}{\ln\!R_r^2R_\ell}}$$

 $\Rightarrow \alpha = 3/4$ 

(also problematic due to prefactor issues)

### Obliviously soldiering on, we could assert:

- & space-fillingness:  $R_\ell = R_n^{-1/3}$

### Geometric argument

Best and worst configurations (Banavar et al.)

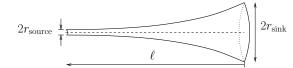

Rather obviously:

min  $V_{\rm net} \propto \sum$  distances from source to sinks.

### Minimal network volume:

### We add one more element:

Nessel cross-sectional area may vary with distance from the

Flow rate increases as cross-sectional area decreases.

& e.g., a collection network may have vessels tapering as they approach the central sink.

& Find that vessel volume v must scale with vessel length  $\ell$  to affect overall system scalings.

### Spherical cows and pancake cows:

Assume an isometrically Scaling family of cows:

Extremes of allometry: The pancake cows-

# Minimal network volume:

### Real supply networks are close to optimal:

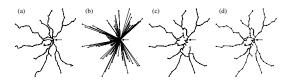

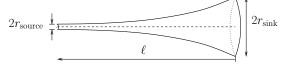

Figure 1. (a) Commuter rail network in the Boston area. The arrow marks the assumed root of the network. (b) Star graph. (c) Minimum spanning tree. (d) The model of equation (3) applied to the same set of stations

Gastner and Newman (2006): "Shape and efficiency in spatial distribution networks" [16]

### Minimal network volume:

### Effecting scaling:

& Consider vessel radius  $r \propto (\ell+1)^{-\epsilon}$ , tapering from  $r=r_{\rm max}$ where  $\epsilon > 0$ .

& Gives  $v \propto \ell^{1-2\epsilon}$  if  $\epsilon < 1/2$ 

 $\Re$  Gives  $v \propto 1 - \ell^{-(2\epsilon - 1)} \to 1$  for large  $\ell$  if  $\epsilon > 1/2$ 

 $\Re$  Previously, we looked at  $\epsilon = 0$  only.

Optimal Supply Networks II Metabolism and

Truthicide Death by fractions

Measuring exponent

#### Minimal network volume:

For  $0 \le \epsilon < 1/2$ , approximate network volume by integral over region:

$$\min V_{\rm net} \propto \int_{\Omega_{d,D}(V)} \rho \, ||\vec{x}||^{1-2\epsilon} \, \mathrm{d}\vec{x}$$

Insert assignment question 🗹

$$\propto 
ho V^{1+\gamma_{\max}(1-2\epsilon)}$$
 where  $\gamma_{\max} = \max_i \gamma_i$ .

For  $\epsilon > 1/2$ , find simply that

$$\min V_{
m net} \propto 
ho V$$

So if supply lines can taper fast enough and without limit, minimum network volume can be made negligible.

### For $0 \le \epsilon < 1/2$ :

- A If scaling is isometric, we have  $\gamma_{max} = 1/d$ :

$$\min V_{
m net/iso} \propto 
ho V^{1+(1-2\epsilon)/d}$$

& If scaling is allometric, we have  $\gamma_{\text{max}} = \gamma_{\text{allo}} > 1/d$ : and

$$\min V_{\rm net/allo} \propto \rho V^{1+(1-2\epsilon)\gamma_{\rm allo}}$$

A Isometrically growing volumes require less network volume than allometrically growing volumes:

$$\frac{\min V_{\rm net/iso}}{\min V_{\rm net/allo}} \rightarrow 0$$
 as  $V \rightarrow \infty$ 

#### For $\epsilon > 1/2$ :

- | min  $V_{\rm net} \propto \rho V$
- Network volume scaling is now independent of overall shape scaling.

### Limits to scaling

- & Can argue that  $\epsilon$  must effectively be 0 for real networks over
- Limit to how fast material can move, and how small material packages can be.
- & e.g., blood velocity and blood cell size.

Stefan-Boltzmann law: 🗷

 $\frac{dE}{dt} = \sigma S T^4$ 

where S is surface and T is temperature.

Very rough estimate of prefactor based on scaling of normal mammalian body temperature and surface area S:

$$B \simeq 10^5 M^{2/3} {
m erg/sec}.$$

 $\clubsuit$  Measured for M < 10 kg:

$$B = 2.57 \times 10^5 M^{2/3} \text{erg/sec.}$$

Optimal Supply Networks II Metabolism and

Truthicide Death by fractions

Measuring exponent

Earlier theories

#### River networks

- View river networks as collection networks.
- Many sources and one sink.
- &  $\epsilon$ ?
- Assume  $\rho$  is constant over time and  $\epsilon = 0$ :

$$V_{\rm net} \propto \rho V^{(d+1)/d} = {\rm constant} \times V^{3/2}$$

- Network volume grows faster than basin 'volume' (really
- & It's all okay:

Landscapes are d=2 surfaces living in D=3 dimensions.

- Streams can grow not just in width but in depth ...
- $Regional If \epsilon > 0$ ,  $V_{\rm net}$  will grow more slowly but 3/2 appears to be confirmed from real data.

#### Hack's law

- Nolume of water in river network can be calculated by adding up basin areas
- Rows sum in such a way that

$$V_{\text{net}} = \sum_{\text{all pixels}} a_{\text{pixel }i}$$

A Hack's law again:

$$\ell \sim a^h$$

& Can argue

$$V_{
m net} \propto V_{
m basin}^{1+h} = a_{
m basin}^{1+h}$$

where h is Hack's exponent.

∴ minimal volume calculations gives

$$h = 1/2$$

### Conclusion

- Supply network story consistent with dimensional analysis.
- A Isometrically growing regions can be more efficiently supplied than allometrically growing ones.
- Ambient and region dimensions matter (D = d versus D > d).
- Deviations from optimal scaling suggest inefficiency (e.g., gravity for organisms, geological boundaries).
- Actual details of branching networks not that important.
- Exact nature of self-similarity varies.
- 2/3-scaling lives on, largely in hiding.
- 3/4-scaling? Jury ruled a mistrial.
- The truth will out. Maybe.
