References

Network: (net + work, 1500's)

Noun:

1. Any interconnected group or system
2. Multiple computers and other devices connected together to share information

Verb:

1. To interact socially for the purpose of getting connections or personal advancement
2. To connect two or more computers or other computerized devices

References

- ▶ Many complex systems can be regarded as complex networks of physical or abstract interactions
- ▶ Opens door to mathematical and numerical analysis
- ▶ Dominant approach of last decade of a theoretical-physics/stat-mechish flavor.

Examples

Interaction networks: social networks

- ▶ Snogging
- ▶ Friendships
- ▶ Acquaintances
- ▶ Boards and directors
- ▶ Organizations
- ▶ myspace.com (田),
- ▶ facebook.com (田)

The Structure of Romantic and Sexual Relations at "Jefferson High School"

Each circle represents a student and lines connecting students represent romantic relations occurring within the 6 months preceding the interview. Numbers under the figure count the number of times that pattern was observed (i.e. we found 63 pairs unconnected to anyone else).

(Bearman *et al.*, 2004)

- ▶ 'Remotely sensed' by: email activity, instant messaging, phone logs (*cough*).

A notable features of large-scale networks:

- ▶ Graphical renderings of complex networks are often just a big mess.
- ▶ Need to be able to extract key patterns
- ▶ Science of Description

Some key aspects of real complex networks:

- ▶ degree distribution
 - ▶ assortativity
 - ▶ homophily
 - ▶ clustering
 - ▶ motifs
 - ▶ modularity
 - ▶ concurrency
 - ▶ hierarchical scaling
 - ▶ network distances
 - ▶ centrality
 - ▶ efficiency
 - ▶ robustness
- ▶ + Coevolution of network structure and processes on networks.

$$\frac{d}{dt}k_{i,t} = m \frac{k_i(t)}{\sum_{j=1}^{N(t)} k_j(t)}$$

where $t = N(t) - m_0$.

Approximate analysis

- Deal with denominator: each added node brings m new edges.

$$\therefore \sum_{j=1}^{N(t)} k_j(t) = 2tm$$

- The node degree equation now simplifies:

$$\frac{d}{dt} k_{i,t} = m \frac{k_i(t)}{\sum_{j=1}^{N(t)} k_j(t)} = m \frac{k_i(t)}{2mt} = \frac{1}{2t} k_i(t)$$

- Rearrange and solve:

$$\frac{dk_i(t)}{k_i(t)} = \frac{dt}{2t} \Rightarrow k_i(t) = c_i t^{1/2}$$

- Next find $c_i \dots$

$$\therefore \sum_{j=1}^{N(t)} k_j(t) = 2tm$$

- The node degree equation now simplifies:

$$\frac{d}{dt} k_{i,t} = m \frac{k_i(t)}{\sum_{j=1}^{N(t)} k_j(t)} = m \frac{k_i(t)}{2mt} = \frac{1}{2t} k_i(t)$$

- Rearrange and solve:

$$\frac{dk_i(t)}{k_i(t)} = \frac{dt}{2t} \Rightarrow \boxed{k_i(t) = c_i t^{1/2}}$$

- Next find c_i ...

WWW	$\gamma \simeq 2.1$ for in-degree
WWW	$\gamma \simeq 2.45$ for out-degree
Movie actors	$\gamma \simeq 2.3$
Words (synonyms)	$\gamma \simeq 2.8$

The Internet's is a different business...

From Barabási and Albert's original paper [3]:

Fig. 1. The distribution function of connectivities for various large networks. **(A)** Actor collaboration graph with $N = 212,250$ vertices and average connectivity $\langle k \rangle = 28.78$. **(B)** WWW, $N = 325,729$, $\langle k \rangle = 5.46$ (6). **(C)** Power grid data, $N = 4941$, $\langle k \rangle = 2.67$. The dashed lines have slopes **(A)** $\gamma_{\text{actor}} = 2.3$, **(B)** $\gamma_{\text{www}} = 2.1$ and **(C)** $\gamma_{\text{power}} = 4$.

Things to do and questions

- ▶ Vary attachment kernel.
- ▶ Vary mechanisms:
 1. Add edge deletion
 2. Add node deletion
 3. Add edge rewiring
- ▶ Deal with directed versus undirected networks.
- ▶ **Important Q.:** Are there distinct universality classes for these networks?
- ▶ **Q.:** How does changing the model affect γ ?
- ▶ **Q.:** Do we need preferential attachment and growth?
- ▶ **Q.:** Do model details matter?
- ▶ The answer is (surprisingly) **yes**. More later re Zipf.

Preferential attachment through randomness

- ▶ Instead of attaching preferentially, allow new nodes to attach randomly.
- ▶ Now add an **extra step**: new nodes then connect to some of their friends' friends.
- ▶ Can also do this **at random**.
- ▶ Assuming the existing network is random, we know probability of a **random friend** having degree k is

$$Q_k \propto kP_k$$

- ▶ So **rich-gets-richer** scheme can now be seen to work in a natural way.

networks

References

- ▶ Scale-free networks are thus **robust to random failures** yet **fragile to targeted ones**.
- ▶ All very reasonable: **Hubs** are a big deal.
- ▶ **But:** next issue is whether hubs are vulnerable or not.
- ▶ Representing all webpages as the same size node is obviously a stretch (e.g., google vs. a random person's webpage)
- ▶ Most connected nodes are either:
 1. Physically larger nodes that may be harder to 'target'
 2. or subnetworks of smaller, normal-sized nodes.
- ▶ Need to explore cost of various targeting schemes.

The social world appears to be small...

- ▶ Connected **random networks** have short average path lengths:

$$\langle d_{AB} \rangle \sim \log(N)$$

N = population size,

d_{AB} = distance between nodes A and B .

- ▶ **But: social networks aren't random...**

The social world appears to be small...

- ▶ Connected **random networks** have short average path lengths:

$$\langle d_{AB} \rangle \sim \log(N)$$

N = population size,

d_{AB} = distance between nodes A and B .

- ▶ **But: social networks aren't random...**

Simple socialness in a network:

Need “clustering” (your friends are likely to know each other):

Non-randomness gives clustering:

$d_{AB} = 10 \rightarrow$ too many long paths.

Randomness + regularity

Now have $d_{AB} = 3$

$\langle d \rangle$ decreases overall

Small-world networks

Introduced by Watts and Strogatz (Nature, 1998) ^[15]

“Collective dynamics of ‘small-world’ networks.”

Small-world networks were found everywhere:

- ▶ neural network of *C. elegans*,
- ▶ semantic networks of languages,
- ▶ actor collaboration graph,
- ▶ food webs,
- ▶ social networks of comic book characters,...

Very weak requirements:

- ▶ local regularity + random shortcuts

Previous work—finding short paths

- ▶ What can a local search method reasonably use?
- ▶ How to find things without a map?
- ▶ Need some measure of distance between friends and the target.

Some possible knowledge:

- ▶ Target's identity
- ▶ Friends' popularity
- ▶ Friends' identities
- ▶ Where message has been

Previous work—finding short paths

Kleinberg's Network:

1. Start with regular d -dimensional cubic lattice.
2. Add local links so nodes know all nodes within a distance q .
3. Add m short cuts per node.
4. Connect i to j with probability

$$p_{ij} \propto x_{ij}^{-\alpha}.$$

- ▶ $\alpha = 0$: random connections.
- ▶ α large: reinforce local connections.
- ▶ $\alpha = d$: same number of connections at all scales.

- ▶ Individuals know the identity vectors of
 1. themselves,
 2. their friends,
and
 3. the target.
- ▶ Individuals can estimate the social distance between their friends and the target.
- ▶ Use a greedy algorithm + allow searches to fail randomly.

The model-results—searchable networks

q = probability an arbitrary message chain reaches a target.

- ▶ A few dimensions help.
- ▶ Searchability decreases as population increases.
- ▶ Precise form of hierarchy largely doesn't matter.

The model-results

Milgram's Nebraska-Boston data:

Model parameters:

- ▶ $N = 10^8$,
 - ▶ $z = 300, g = 100$,
 - ▶ $b = 10$,
 - ▶ $\alpha = 1, H = 2$;
-
- ▶ $\langle L_{\text{model}} \rangle \simeq 6.7$
 - ▶ $L_{\text{data}} \simeq 6.5$

Social Search—Real world uses

- ▶ Tags create identities for objects
- ▶ Website tagging: `http://www.del.icio.us`
- ▶ (e.g., Wikipedia)
- ▶ Photo tagging: `http://www.flickr.com`
- ▶ Dynamic creation of metadata plus links between information objects.
- ▶ Folksonomy: collaborative creation of metadata

Recommender systems:

- ▶ Amazon uses people's actions to build effective connections between books.
- ▶ Conflict between 'expert judgments' and tagging of the hoi polloi.

Recommender systems:

- ▶ Amazon uses people's actions to build effective connections between books.
- ▶ Conflict between 'expert judgments' and tagging of the hoi polloi.

- ▶ Bare networks are typically unsearchable.
- ▶ Paths are findable if nodes understand how network is formed.
- ▶ Importance of identity (interaction contexts).
- ▶ Improved social network models.
- ▶ Construction of peer-to-peer networks.
- ▶ Construction of searchable information databases.
