Basics:

- ▶ **Instructor:** Prof. Peter Dodds
- ▶ **Lecture room and meeting times:**
220 Votey, Tuesday and Thursday, 11:00 am to 12:30 pm
- ▶ **Office:** 203 Lord House, 16 Colchester Avenue
- ▶ **E-mail:** pdodds@uvm.edu
- ▶ **Website:**
<http://www.uvm.edu/~pdodds/teaching/2008-08UVM-300/> (田)
- ▶ **Suggested Texts:**
 - ▶ “Critical Phenomena in Natural Sciences: Chaos, Fractals, Selforganization and Disorder: Concepts and Tools” by Didier Sornette^[12].
 - ▶ “Critical Mass: How One Thing Leads to Another” by Philip Ball^[3]

Grading breakdown:

- ▶ **Projects/talks (55%)**—Students will work on semester-long projects. Students will develop a proposal in the first few weeks of the course which will be discussed with the instructor for approval.
Details: 15% for the first talk, 20% for the final talk, and 20% for the written project.
- ▶ **Assignments (40%)**—All assignments will be of equal weight and there will be three or four of them.
- ▶ **General attendance/Class participation (5%)**

How grading works:

Questions are worth 3 points according to the following scale:

- ▶ 3 = correct or very nearly so.
- ▶ 2 = acceptable but needs some revisions.
- ▶ 1 = needs major revisions.
- ▶ 0 = way off.

Important dates:

1. Classes run from Tuesday, September 2nd to Thursday, December 11.
2. Add/Drop, Audit, Pass/No Pass deadline—Monday, September 15.
3. Last day to withdraw—Friday, October 31.
4. Reading and exam period—Friday, December 12th to Friday, December 19th.

Definitions

Possible properties of a **Complex System**:

- ▶ Many interacting agents or entities
- ▶ Relationships are nonlinear
- ▶ Presence of feedback
- ▶ Complex systems are open (out of equilibrium)
- ▶ Presence of memory
- ▶ Modular/multiscale/hierarchical structure
- ▶ Evidence of emergence properties
- ▶ Evidence of self-organization

Frame 29/108

Definitions

Complicated versus Complex.

- ▶ Complicated: Mechanical watches, airplanes, ...
- ▶ Engineered systems can be made to be **highly robust but not adaptable**.
- ▶ But engineered systems can become complex (power grid, planes).
- ▶ They can also fail spectacularly.
- ▶ Explicit distinction: Complex Adaptive Systems.

Cosma Shalizi:

“The "sciences of complexity" are very much a potpourri, and while the name has some justification—chaotic motion seems more complicated than harmonic oscillation, for instance—I think the fact that it is more dignified than "neat nonlinear nonsense" has not been the least reason for its success.—That opinion wasn't exactly changed by working at the Santa Fe Institute for five years.”

Welcome to the COMPLEXITY SOCIETY

"The Application of Complexity Science to Human Affairs"

Membership
To join TCS apply here.

Complexity Society Newsletter
The August 2007 edition is now available.

Complexity Society
The current issue of Complexity Society 2007.29 is now available on-line.

Recent Events
Summer School in Complexity Science organised by Imperial College, London, Wye College, Kent, UK. 8-17th July 2007.

Upcoming Events
ECSW European Conference on Complex Systems, Dresden, Germany. 1-5th October 2007.

New Paper
The Fractal Imagination: New Resources for Conceptualising Creativity.

Journal
"Emergence, Complexity & Organization (ECO): A Journal of research, theory and practice on organisations as complex systems."

The Complexity Society provides a focal point for people in the UK interested in complexity. It is a community that uses complexity science to rethink and reinterpret all aspects of the world in which we live and work.

Its core values are OPENNESS, EQUALITY and DIVERSITY.

- Open to all, open to ideas, open in process and activities
- Equality, egalitarian, non-hierarchical, participative
- Diverse, connecting and embracing a wide range of views, respecting differences

The society objectives are to promote the theory of complexity in education, government, the health service and business as well as the beneficial application of complexity in a wide variety of social, economic, scientific and technological contexts such as sources of competitive advantage, business clusters and knowledge management.

Complexity includes ideas such as complex adaptive systems, self-organisation, co-evolution, agent based computer models, chaos, networks, emergence and fractals.

Membership is open to all and current members include people from universities, business, and government funded organisations.

Emergence

Even mathematics:^[9]

Gödel's Theorem (roughly):
we can't prove every theorem that's true.

Suggests a **strong form of emergence**:

Some phenomena cannot be formally deduced from elementary aspects of a system.

Emergence

The idea of emergence is rather old...

“The whole is more than the sum of its parts” –Aristotle

Philosopher G. H. Lewes first used the word explicitly in 1875.

Frame 48/108

Definitions

There appears to be **two types of emergence**:

Weak emergence:

System-level phenomena is different from that of its constituent parts yet can be connected theoretically.

Strong emergence:

System-level phenomena fundamentally cannot be deduced from how parts interact.

(Strong emergence is what Mark Bedau calls **magic**...)

Complex Systems enthusiasts often decry **reductionist** approaches . . .

But reductionism seems to be misunderstood.

Reductionist techniques can explain weak emergence (e.g., phase transitions).

‘A Miracle Occurs’ explains strong emergence.

Reductionism

Reductionism and food:

- ▶ *Unhappy Meals*, Michael Pollan, NY Times, January 2007
- ▶ “even the simplest food is a hopelessly complex thing to study, a virtual wilderness of chemical compounds, many of which exist in complex and dynamic relation to one another...”
- ▶ “So ... break the thing down into its component parts and study those one by one, even if that means ignoring complex interactions and contexts, as well as the fact that the whole may be more than, or just different from, the sum of its parts. This is what we mean by reductionist science.”

Reductionism

“It would be great to know how this all works, but **in the meantime** we can enjoy thyme in the knowledge that it probably doesn’t do any harm (since people have been eating it forever) and that it may actually do some good (since people have been eating it forever) and that even if it does nothing, we like the way it tastes.”

Gulf between theory and practice: baseball and bumblebees.

Frame 57/108

Emergence

Strong: constraints on the global structure may not be observable by viewing behavior of individual parts.

Not a pure micro-to-macro story.

Still... seems that analysis of the system is possible by thinking about the parts.

And centralized control is a simple system-level feature.

Definitions

Self-Organization

“Self-organization is a process in which the internal organization of a system, normally an open system, increases in complexity without being guided or managed by an outside source.”
(also: Self-assembly)

Upshot

- ▶ The central concepts **Complexity** and **Emergence** are not well defined.
- ▶ There is **no general theory of Complex Systems**.
- ▶ But the problems exist...
Complex (Adaptive) Systems abound...
- ▶ • We use whatever tools we need.

Hmmm

Two ways for order to appear in a system without offending the second law of thermodynamics:

(1) Entropy of the system decreases at the expense of entropy increasing in the environment.

(2) The system becomes more ordered macroscopically while becoming more disordered microscopically.

Measures of Complexity

So maybe no one true measure of complexity exists.

Cosma Shalizi:

“Every few months seems to produce another paper proposing yet another measure of complexity, generally a quantity which can’t be computed for anything you’d actually care to know about, if at all. These quantities are almost never related to any other variable, so they form no part of any theory telling us when or how things get complex, and are usually just quantification for quantification’s own sweet sake.”
