## The essential random walk:

- ▶ One spatial dimension.
- ▶ Time and space are discrete
- ▶ Random walker (e.g., a drunk) starts at origin  $x = 0$ .
- ▶ Step at time  $t$  is  $\epsilon_t$ :

$$\epsilon_t = \begin{cases} +1 & \text{with probability } 1/2 \\ -1 & \text{with probability } 1/2 \end{cases}$$

# Random walks

⇒ A non-trivial power-law arises out of  
additive aggregation or accumulation.

# Random walks

Random walks are weirder than you might think...

For example:

- ▶  $C_{r,r}$  = the probability that by time step  $t$ , a random walk has crossed the origin  $r$  times.
- ▶ Think of a coin flip game with ten thousand tosses.
- ▶ If you are behind early on, what are the chances you will make a comeback?
- ▶ The most likely number of lead changes is...

# Random walks

Random walks are weirder than you might think...

For example:

- ▶  $\xi_{r,t}$  = the probability that by time step  $t$ , a random walk has crossed the origin  $r$  times.
- ▶ Think of a coin flip game with ten thousand tosses.
- ▶ If you are behind early on, what are the chances you will make a comeback?
- ▶ The most likely number of lead changes is...

# First returns

## Reasons for caring:

1. We will find a power-law size distribution with an interesting exponent
2. Some physical structures may result from random walks
3. We'll start to see how different scalings relate to each other

## Key observation:

# of  $t$ -step paths starting and ending at  $x = 1$

and hitting  $x = 0$  at least once

= # of  $t$ -step paths starting at  $x = -1$  and ending at  $x = 1$

=  $N(-1, 1, t)$

So  $N_{\text{first return}}(2n) = N(1, 1, 2n - 2) - N(-1, 1, 2n - 2)$

See this 1-1 correspondence visually...

- ▶ Power-law relationship between variables:

$$y = cx^{-\alpha}, \alpha > 0$$

- ▶ Look at  $y$  large and  $x$  small

$$dy = d(cx^{-\alpha})$$

$$= c(-\alpha)x^{-\alpha-1}dx$$

invert:  $dx = \frac{-1}{c\alpha}x^{\alpha+1}dy$

# General Example

Assume relationship between  $x$  and  $y$  is 1-1.

- ▶ Power-law relationship between variables:

$$y = cx^{-\alpha}, \alpha > 0$$

- ▶ Look at  $y$  large and  $x$  small

$$dy = d(cx^{-\alpha})$$

$$= c(-\alpha)x^{-\alpha-1}dx$$

$$\text{invert: } dx = \frac{-1}{c\alpha}x^{\alpha+1}dy$$

$$dx = \frac{-1}{c\alpha} \left(\frac{y}{c}\right)^{-(\alpha+1)/\alpha} dy$$

# General Example

Assume relationship between  $x$  and  $y$  is 1-1.

- ▶ Power-law relationship between variables:

$$y = cx^{-\alpha}, \alpha > 0$$

- ▶ Look at  $y$  large and  $x$  small

$$dy = d(cx^{-\alpha})$$

$$= c(-\alpha)x^{-\alpha-1}dx$$

invert:  $dx = \frac{-1}{c\alpha}x^{\alpha+1}dy$

$$dx = \frac{-1}{c\alpha} \left(\frac{y}{c}\right)^{-(\alpha+1)/\alpha} dy$$

$$dx = \frac{-c^{1/\alpha}}{\alpha} y^{-1-1/\alpha} dy$$

# General Example

Now make transformation:

$$P_y(y)dy = P_x(x)dx$$

- ▶ If  $P_x(x) \rightarrow$  non-zero constant as  $x \rightarrow 0$  then

$$P_y(y) \propto y^{-1-1/\alpha} \text{ as } y \rightarrow \infty.$$

- ▶ If  $P_x(x) \rightarrow x^\beta$  as  $x \rightarrow 0$  then

$$P_y(y) \propto y^{-1-1/\alpha-\beta/\alpha} \text{ as } y \rightarrow \infty.$$

# General Example

Now make transformation:

$$P_Y(y)dy = P_X(x)dx$$

$$P_Y(y)dy = P_X \left( \overbrace{\left( \frac{y}{c} \right)^{-1/\alpha}}^{(x)} \right) \overbrace{\frac{c^{1/\alpha}}{\alpha} y^{-1-1/\alpha} dy}^{dx}$$

- ▶ If  $P_X(x) \rightarrow$  non-zero constant as  $x \rightarrow 0$  then

$$P_Y(y) \propto y^{-1-1/\alpha} \text{ as } y \rightarrow \infty.$$

- ▶ If  $P_X(x) \rightarrow x^\beta$  as  $x \rightarrow 0$  then

$$P_Y(y) \propto y^{-1-1/\alpha-\beta/\alpha} \text{ as } y \rightarrow \infty.$$

# General Example

Now make transformation:

$$P_y(y)dy = P_x(x)dx$$

$$P_y(y)dy = P_x \left( \overbrace{\left( \frac{y}{c} \right)^{-1/\alpha}}^{(x)} \right) \overbrace{\frac{c^{1/\alpha}}{\alpha} y^{-1-1/\alpha} dy}^{dx}$$

- ▶ If  $P_x(x) \rightarrow$  non-zero constant as  $x \rightarrow 0$  then

$$P_y(y) \propto y^{-1-1/\alpha} \text{ as } y \rightarrow \infty.$$

- ▶ If  $P_x(x) \rightarrow x^\beta$  as  $x \rightarrow 0$  then

$$P_y(y) \propto y^{-1-1/\alpha-\beta/\alpha} \text{ as } y \rightarrow \infty.$$

# General Example

Now make transformation:

$$P_y(y)dy = P_x(x)dx$$

$$P_y(y)dy = P_x \left( \overbrace{\left(\frac{y}{c}\right)^{-1/\alpha}}^{(x)} \right) \overbrace{\frac{c^{1/\alpha}}{\alpha} y^{-1-1/\alpha} dy}^{dx}$$

- ▶ If  $P_x(x) \rightarrow$  non-zero constant as  $x \rightarrow 0$  then

$$P_y(y) \propto y^{-1-1/\alpha} \text{ as } y \rightarrow \infty.$$

- ▶ If  $P_x(x) \rightarrow x^\beta$  as  $x \rightarrow 0$  then

$$P_y(y) \propto y^{-1-1/\alpha-\beta/\alpha} \text{ as } y \rightarrow \infty.$$

# Example

## Exponential distribution

Given  $P_x(x) = \frac{1}{\lambda} e^{-x/\lambda}$  and  $y = cx^{-\alpha}$ , then

$$P(y) \propto y^{-1-1/\alpha} + O\left(y^{-1-2/\alpha}\right)$$

## Evidence for Zipf's law...

FIG. 1 (color online). (Color Online) Log-log plot of the number of packages in four Debian Linux Distributions with more than  $C$  in-directed links. The four Debian Linux Distributions are Woody (19.07.2002) (orange diamonds), Sarge (06.06.2005) (green crosses), Etc (15.08.2007) (blue circles), Lenny (15.12.2007) (black+'s). The inset shows the maximum likelihood estimate (MLE) of the exponent  $\mu$  together with two boundaries defining its 95% confidence interval (approximately given by  $1 \pm 2/\sqrt{n}$ , where  $n$  is the number of data points using in the MLE), as a function of the lower threshold. The MLE has been modified from the standard Hill estimator to take into account the discreteness of  $C$ .

References

# Random Competitive Replication

## Example: Words in a text

- ▶ Consider words as they appear sequentially.
- ▶ With probability  $\rho$ , the next word has not previously appeared
  - ▶ **Mutation/Innovation**
- ▶ With probability  $1 - \rho$ , randomly choose one word from all words that have come before, and reuse this word

# Random Competitive Replication

Stochastic difference equation:

$$\langle N_k(t+1) - N_k(t) \rangle = (1 - \rho) \left( (k-1) \frac{N_{k-1}(t)}{t} - k \frac{N_k(t)}{t} \right)$$

becomes

$$n_k(t+1) - n_k t = (1 - \rho) \left( (k-1) \frac{n_{k-1} t}{t} - k \frac{n_k t}{t} \right)$$

$$n_k(t+1 - t) = (1 - \rho) \left( (k-1) \frac{n_{k-1} t}{t} - k \frac{n_k t}{t} \right)$$

$$\Rightarrow n_k = (1 - \rho) ((k-1)n_{k-1} - kn_k)$$

$$\Rightarrow n_k (1 + (1 - \rho)k) = (1 - \rho)(k-1)n_{k-1}$$

# Random Competitive Replication

We had one other equation:

$$\langle N_1(t+1) - N_1(t) \rangle = \rho - (1 - \rho)1 \cdot \frac{N_1(t)}{t}$$

▶ As before, set  $N_1(t) = n_1 t$  and drop expectations

$$n_1(t+1) - n_1 t = \rho - (1 - \rho)1 \cdot \frac{n_1 t}{t}$$

$$n_1 = \rho - (1 - \rho)n_1$$

▶ Rearrange:

$$n_1 + (1 - \rho)n_1 = \rho$$

$$n_1 = \frac{\rho}{2 - \rho}$$

# Random Competitive Replication

We had one other equation:

$$\langle N_1(t+1) - N_1(t) \rangle = \rho - (1 - \rho)1 \cdot \frac{N_1(t)}{t}$$

▶ As before, set  $N_1(t) = n_1 t$  and drop expectations

$$n_1(t+1) - n_1 t = \rho - (1 - \rho)1 \cdot \frac{n_1 t}{t}$$

$$n_1 = \rho - (1 - \rho)n_1$$

▶ Rearrange:

$$n_1 + (1 - \rho)n_1 = \rho$$

$$n_1 = \frac{\rho}{2 - \rho}$$

# Random Competitive Replication

We had one other equation:

$N_1$ (real)	$N_1$ (est)	$N_2$ (real)	$N_2$ (est)
16,432	15,850	4,776	4,870

# Evolution of catch phrases

- ▶ Yule's paper (1924) <sup>[14]</sup>:  
"A mathematical theory of evolution, based on the conclusions of Dr J. C. Willis, F.R.S."
- ▶ Simon's paper (1955) <sup>[12]</sup>:  
"On a class of skew distribution functions" (snore)

## From Simon's introduction:

It is the purpose of this paper to analyse a class of distribution functions that appear in a wide range of empirical data—particularly data describing sociological, biological and economic phenomena.

Its appearance is so frequent, and the phenomena so diverse, that one is led to conclude that if these phenomena have any property in common it can only be a similarity in the structure of the underlying probability mechanisms.

- ▶ Yule's paper (1924)<sup>[14]</sup>:  
"A mathematical theory of evolution, based on the conclusions of Dr J. C. Willis, F.R.S."
- ▶ Simon's paper (1955)<sup>[12]</sup>:  
"On a class of skew distribution functions" (snore)

## From Simon's introduction:

It is the purpose of this paper to analyse a class of distribution functions that appear in a wide range of empirical data—particularly data describing sociological, biological and economic phenomena.

Its appearance is so frequent, and the phenomena so diverse, that one is led to conjecture that if these phenomena have any property in common it can only be a similarity in the structure of the underlying probability mechanisms.

## More on Herbert Simon (1916–2001):

- ▶ **Political scientist**
- ▶ Involved in Cognitive Psychology, Computer Science, Public Administration, Economics, Management, Sociology
- ▶ Coined 'bounded rationality' and 'satisficing'
- ▶ Nearly 1000 publications
- ▶ An early leader in Artificial Intelligence, Information Processing, Decision-Making, Problem-Solving, Attention Economics, Organization Theory, Complex Systems, And Computer Simulation Of Scientific Discovery.
- ▶ Nobel Laureate in Economics
