## Pure, abstract random networks:

- ▶ Consider set of all networks with  $N$  labelled nodes and  $m$  edges.
- ▶ Standard random network = one **randomly chosen** network from this set.
- ▶ To be clear: each network is **equally** probable.
- ▶ Sometimes equiprobability is a good assumption, but it is always an assumption.
- ▶ Known as Erdős-Rényi random networks or **ER graphs**.

# Random network generator for $N = 3$ :

- ▶ Get your own exciting generator [here](#) (田).
- ▶ As  $N \nearrow$ , our polyhedral die rapidly becomes a ball...

# Random networks—basic features:

- ▶ Number of possible edges:

$$0 \leq m \leq \binom{N}{2} = \frac{N(N-1)}{2}$$

- ▶ Limit of  $m = 0$ : empty graph.
- ▶ Limit of  $m = \binom{N}{2}$ : complete or fully-connected graph.
- ▶ Number of possible networks with  $N$  labelled nodes:

$$2^{\binom{N}{2}} \sim e^{\frac{\ln 2}{2} N^2}.$$

- ▶ Given  $m$  edges, there are  $\binom{\binom{N}{2}}{m}$  different possible networks.
- ▶ Crazy factorial explosion for  $1 \ll m \ll \binom{N}{2}$ .
- ▶ **Real world:** links are usually costly so real networks are almost always **sparse**.

## How to build standard random networks:

- ▶ Given  $N$  and  $m$ .
  - ▶ Two probabilistic methods (we'll see a third later on)
1. Connect each of the  $\binom{N}{2}$  pairs with appropriate probability  $p$ .
    - ▶ **Useful for theoretical work.**
  2. Take  $N$  nodes and add exactly  $m$  links by selecting edges without replacement.
    - ▶ **Algorithm:** Randomly choose a pair of nodes  $i$  and  $j$ ,  $i \neq j$ , and connect if unconnected; repeat until all  $m$  edges are allocated.
    - ▶ Best for adding relatively small numbers of links (most cases).
    - ▶ 1 and 2 are effectively equivalent for large  $N$ .

# Random networks

## A few more things:

- ▶ For method 1, # links is probabilistic:

$$\langle m \rangle = p \binom{N}{2} = p \frac{1}{2} N(N-1)$$

- ▶ So the expected or **average degree** is

$$\langle k \rangle = \frac{2 \langle m \rangle}{N}$$

$$= \frac{2}{N} p \frac{1}{2} N(N-1) = \frac{2}{N} p \frac{1}{2} N(N-1) = p(N-1).$$

- ▶ Which is what it should be...
- ▶ If we keep  $\langle k \rangle$  constant then  $p \propto 1/N \rightarrow 0$  as  $N \rightarrow \infty$ .

### Example realizations of random networks

- ▶  $N = 500$
- ▶ Vary  $m$ , the number of edges from 100 to 1000.
- ▶ Average degree  $\langle k \rangle$  runs from 0.4 to 4.
- ▶ Look at full network plus the largest component.

# Clustering in random networks:

- ▶ For method 1, what is the clustering coefficient for a finite network?
- ▶ Consider triangle/triple clustering coefficient: [1]

$$C_2 = \frac{3 \times \# \text{triangles}}{\# \text{triples}}$$

- ▶ Recall:  $C_2$  = probability that two friends of a node are also friends.
- ▶ Or:  $C_2$  = probability that a triple is part of a triangle.
- ▶ For standard random networks, we have simply that

$$C_2 = p.$$

# Other ways to compute clustering:

- ▶ Expected number of triples in entire network:

$$\frac{1}{2}N(N-1)(N-2)p^2$$

(Double counting dealt with by  $\frac{1}{2}$ .)

- ▶ Expected number of triangles in entire network:

$$\frac{1}{6}N(N-1)(N-2)p^3$$

(Over-counting dealt with by  $\frac{1}{6}$ .)

$$C_2 = \frac{3 \times \# \text{triangles}}{\# \text{triples}} = \frac{3 \times \frac{1}{6}N(N-1)(N-2)p^3}{\frac{1}{2}N(N-1)(N-2)p^2} = p.$$

# Other ways to compute clustering:

- ▶ Or: take any three nodes, call them  $a$ ,  $b$ , and  $c$ .
- ▶ Triple  $a$ - $b$ - $c$  centered at  $b$  occurs with probability  $p^2 \times (1 - p) + p^2 \times p = p^2$ .
- ▶ Triangle occurs with probability  $p^3$ .
- ▶ Therefore,

$$C_2 = \frac{p^3}{p^2} = p.$$

# Clustering in random networks:

- ▶ So for large random networks ( $N \rightarrow \infty$ ), clustering drops to zero.
- ▶ Key structural feature of random networks is that they locally look like **pure branching networks**
- ▶ No small loops.

# Random networks

## Degree distribution:

- ▶ Recall  $P_k$  = probability that a randomly selected node has degree  $k$ .
- ▶ Consider method 1 for constructing random networks: each possible link is realized with probability  $p$ .
- ▶ Now consider one node: there are ' $N - 1$  choose  $k$ ' ways the node can be connected to  $k$  of the other  $N - 1$  nodes.
- ▶ Each connection occurs with probability  $p$ , each non-connection with probability  $(1 - p)$ .
- ▶ Therefore have a binomial distribution:

$$P(k; p, N) = \binom{N-1}{k} p^k (1-p)^{N-1-k}.$$

## Limiting form of $P(k; p, N)$ :

- ▶ Our degree distribution:

$$P(k; p, N) = \binom{N-1}{k} p^k (1-p)^{N-1-k}.$$

- ▶ What happens as  $N \rightarrow \infty$ ?
- ▶ We must end up with the normal distribution right?
- ▶ If  $p$  is fixed, then we would end up with a Gaussian with average degree  $\langle k \rangle \simeq pN \rightarrow \infty$ .
- ▶ But we want to keep  $\langle k \rangle$  fixed...
- ▶ So examine limit of  $P(k; p, N)$  when  $p \rightarrow 0$  and  $N \rightarrow \infty$  with  $\langle k \rangle = p(N-1) = \text{constant}$ .

# Limiting form of $P(k; p, N)$ :

- Substitute  $p = \frac{\langle k \rangle}{N-1}$  into  $P(k; p, N)$  and hold  $k$  fixed:

$$P(k; p, N) = \binom{N-1}{k} \left( \frac{\langle k \rangle}{N-1} \right)^k \left( 1 - \frac{\langle k \rangle}{N-1} \right)^{N-1-k}$$

$$= \frac{(N-1)!}{k!(N-1-k)!} \frac{\langle k \rangle^k}{(N-1)^k} \left( 1 - \frac{\langle k \rangle}{N-1} \right)^{N-1-k}$$

$$= \frac{(N-1)(N-2)\cdots(N-k)}{k!} \frac{\langle k \rangle^k}{(N-1)^k} \left( 1 - \frac{\langle k \rangle}{N-1} \right)^{N-1-k}$$

$$\approx \frac{\cancel{N^k} \left(1 - \frac{1}{N}\right) \cdots \left(1 - \frac{k}{N}\right)}{k! \cancel{N^k}} \frac{\langle k \rangle^k}{\left(1 - \frac{1}{N}\right)^k} \left( 1 - \frac{\langle k \rangle}{N-1} \right)^{N-1-k}$$

# Limiting form of $P(k; p, N)$ :

- ▶ We are now here:

$$P(k; p, N) \simeq \frac{\langle k \rangle^k}{k!} \left( 1 - \frac{\langle k \rangle}{N-1} \right)^{N-1-k}$$

- ▶ Now use the excellent result:

$$\lim_{n \rightarrow \infty} \left( 1 + \frac{x}{n} \right)^n = e^x.$$

(Use l'Hôpital's rule to prove.)

- ▶ Identifying  $n = N - 1$  and  $x = -\langle k \rangle$ :

$$P(k; \langle k \rangle) \simeq \frac{\langle k \rangle^k}{k!} e^{-\langle k \rangle} \left( 1 - \frac{\langle k \rangle}{N-1} \right)^{-k} \rightarrow \frac{\langle k \rangle^k}{k!} e^{-\langle k \rangle}$$

- ▶ This is a Poisson distribution (⊕) with mean  $\langle k \rangle$ .

# Poisson basics:

$$P(k; \lambda) = \frac{\lambda^k}{k!} e^{-\lambda}$$

- ▶  $\lambda > 0$
- ▶  $k = 0, 1, 2, 3, \dots$
- ▶ Classic use: probability that an event occurs  $k$  times in a given time period, given an average rate of occurrence.
- ▶ e.g.:  
phone calls/minute,  
horse-kick deaths.
- ▶ 'Law of small numbers'

# Poisson basics:

- ▶ Normalization: we must have

$$\sum_{k=0}^{\infty} P(k; \langle k \rangle) = 1$$

- ▶ Checking:

$$\sum_{k=0}^{\infty} P(k; \langle k \rangle) = \sum_{k=0}^{\infty} \frac{\langle k \rangle^k}{k!} e^{-\langle k \rangle}$$

$$= e^{-\langle k \rangle} \sum_{k=0}^{\infty} \frac{\langle k \rangle^k}{k!}$$

$$= e^{-\langle k \rangle} e^{\langle k \rangle} = 1 \checkmark$$

# Poisson basics:

- ▶ Mean degree: we must have

$$\langle k \rangle = \sum_{k=0}^{\infty} kP(k; \langle k \rangle).$$

- ▶ Checking:

$$\begin{aligned}\sum_{k=0}^{\infty} kP(k; \langle k \rangle) &= \sum_{k=0}^{\infty} k \frac{\langle k \rangle^k}{k!} e^{-\langle k \rangle} \\ &= e^{-\langle k \rangle} \sum_{k=1}^{\infty} \frac{\langle k \rangle^k}{(k-1)!} \\ &= \langle k \rangle e^{-\langle k \rangle} \sum_{k=1}^{\infty} \frac{\langle k \rangle^{k-1}}{(k-1)!} \\ &= \langle k \rangle e^{-\langle k \rangle} \sum_{i=0}^{\infty} \frac{\langle k \rangle^i}{i!} = \langle k \rangle e^{-\langle k \rangle} e^{\langle k \rangle} = \langle k \rangle \checkmark\end{aligned}$$

- ▶ Note: We'll get to a better and crazier way of doing this...

# Poisson basics:

- ▶ The **variance** of degree distributions for random networks turns out to be **very important**.
- ▶ Use calculation similar to one for finding  $\langle k \rangle$  to find the **second moment**:

$$\langle k^2 \rangle = \langle k \rangle^2 + \langle k \rangle.$$

- ▶ Variance is then

$$\sigma^2 = \langle k^2 \rangle - \langle k \rangle^2 = \langle k \rangle^2 + \langle k \rangle - \langle k \rangle^2 = \langle k \rangle.$$

- ▶ So standard deviation  $\sigma$  is equal to  $\sqrt{\langle k \rangle}$ .
- ▶ Note: This is a special property of Poisson distribution and can trip us up...

# General random networks

- ▶ So... standard random networks have a Poisson degree distribution
- ▶ Generalize to arbitrary degree distribution  $P_k$ .
- ▶ Also known as the **configuration model**.<sup>[1]</sup>
- ▶ Can generalize construction method from ER random networks.
- ▶ Assign each node a weight  $w$  from some distribution  $P_w$  and form links with probability

$$P(\text{link between } i \text{ and } j) \propto w_i w_j.$$

- ▶ But we'll be more interested in
  1. Randomly wiring up (and rewiring) already existing nodes with fixed degrees.
  2. Examining mechanisms that lead to networks with certain degree distributions.

# Random networks: examples

## Coming up:

Example realizations of random networks with power law degree distributions:

- ▶  $N = 1000$ .
- ▶  $P_k \propto k^{-\gamma}$  for  $k \geq 1$ .
- ▶ Set  $P_0 = 0$  (no isolated nodes).
- ▶ Vary exponent  $\gamma$  between 2.10 and 2.91.
- ▶ Again, look at full network plus the largest component.
- ▶ Apart from degree distribution, wiring is random.

# The edge-degree distribution:

- ▶ The degree distribution  $P_k$  is fundamental for our description of many complex networks
- ▶ Again:  $P_k$  is the degree of **randomly chosen node**.
- ▶ A second very important distribution arises from **choosing randomly on edges** rather than on nodes.
- ▶ Define  $Q_k$  to be the probability the node at a **random end** of a **randomly chosen edge** has degree  $k$ .
- ▶ Now choosing nodes based on their degree (i.e., size):

$$Q_k \propto kP_k$$

- ▶ Normalized form:

$$Q_k = \frac{kP_k}{\sum_{k'=0}^{\infty} k'P_{k'}} = \frac{kP_k}{\langle k \rangle}.$$

# The edge-degree distribution:

- ▶ For random networks,  $Q_k$  is also the probability that a friend (neighbor) of a random node has  $k$  friends.
- ▶ Useful variant on  $Q_k$ :

$R_k$  = probability that a friend of a random node has  $k$  other friends.

$$R_k = \frac{(k+1)P_{k+1}}{\sum_{k'=0} (k'+1)P_{k'+1}} = \frac{(k+1)P_{k+1}}{\langle k \rangle}$$

- ▶ Equivalent to friend having degree  $k+1$ .
- ▶ **Natural question:** what's the expected number of other friends that one friend has?

# The edge-degree distribution:

- ▶ Given  $R_k$  is the probability that a friend has  $k$  other friends, then the average number of **friends' other friends** is

$$\begin{aligned}\langle k \rangle_R &= \sum_{k=0}^{\infty} k R_k = \sum_{k=0}^{\infty} k \frac{(k+1) P_{k+1}}{\langle k \rangle} \\ &= \frac{1}{\langle k \rangle} \sum_{k=1}^{\infty} k(k+1) P_{k+1}\end{aligned}$$

$$= \frac{1}{\langle k \rangle} \sum_{k=1}^{\infty} ((k+1)^2 - (k+1)) P_{k+1}$$

(where we have sneakily matched up indices)

$$\begin{aligned}&= \frac{1}{\langle k \rangle} \sum_{j=0}^{\infty} (j^2 - j) P_j \quad (\text{using } j = k+1) \\ &= \frac{1}{\langle k \rangle} (\langle k^2 \rangle - \langle k \rangle)\end{aligned}$$

# The edge-degree distribution:

- ▶ Note: our result,  $\langle k \rangle_R = \frac{1}{\langle k \rangle} (\langle k^2 \rangle - \langle k \rangle)$ , is true for **all** random networks, **independent of degree distribution**.

- ▶ For standard random networks, recall

$$\langle k^2 \rangle = \langle k \rangle^2 + \langle k \rangle.$$

- ▶ Therefore:

$$\langle k \rangle_R = \frac{1}{\langle k \rangle} (\langle k \rangle^2 + \langle k \rangle - \langle k \rangle) = \langle k \rangle$$

- ▶ Again, neatness of results is a special property of the Poisson distribution.
- ▶ So friends on average have  $\langle k \rangle$  other friends, and  $\langle k \rangle + 1$  total friends...

# Two reasons why this matters

## Reason #1:

- ▶ Average # friends of friends per node is

$$\langle k_2 \rangle = \langle k \rangle \times \langle k \rangle_R = \langle k \rangle \frac{1}{\langle k \rangle} (\langle k^2 \rangle - \langle k \rangle) = \langle k^2 \rangle - \langle k \rangle.$$

- ▶ Key: Average depends on the **1st and 2nd moments** of  $P_k$  and **not just the 1st moment**.
- ▶ Three peculiarities:
  1. We might guess  $\langle k_2 \rangle = \langle k \rangle (\langle k \rangle - 1)$  but it's actually  $\langle k(k - 1) \rangle$ .
  2. If  $P_k$  has a **large second moment**, then  $\langle k_2 \rangle$  will be big. (e.g., in the case of a power-law distribution)
  3. Your friends really are different from you...

# Two reasons why this matters

## More on peculiarity #3:

- ▶ A node's average # of friends:  $\langle k \rangle$
- ▶ Friend's average # of friends:  $\frac{\langle k^2 \rangle}{\langle k \rangle}$
- ▶ Comparison:

$$\frac{\langle k^2 \rangle}{\langle k \rangle} = \langle k \rangle \frac{\langle k^2 \rangle}{\langle k \rangle^2} = \langle k \rangle \frac{\sigma^2 + \langle k \rangle^2}{\langle k \rangle^2} = \langle k \rangle \left( 1 + \frac{\sigma^2}{\langle k \rangle^2} \right) \geq \langle k \rangle$$

- ▶ So only if everyone has the same degree (variance =  $\sigma^2 = 0$ ) can a node be the same as its friends.
- ▶ Intuition: for random networks, the more connected a node, the more likely it is to be chosen as a friend.

# Two reasons why this matters

## (Big) Reason #2:

- ▶  $\langle k \rangle_R$  is **key** to understanding how well random networks are connected together.
- ▶ e.g., we'd like to know what's the size of the largest component within a network.
- ▶ As  $N \rightarrow \infty$ , does our network have a **giant component**?
- ▶ **Defn:** Component = connected subnetwork of nodes such that  $\exists$  path between each pair of nodes in the subnetwork, and no node outside of the subnetwork is connected to it.
- ▶ **Defn:** Giant component = component that comprises a non-zero fraction of a network as  $N \rightarrow \infty$ .
- ▶ Note: Component = Cluster

## Giant component:

- ▶ A giant component exists if when we follow a random edge, we are likely to hit a node with **at least 1** other outgoing edge.
- ▶ Equivalently, expect exponential growth in node number as we move out from a random node.
- ▶ All of this is the same as requiring  $\langle k \rangle_R > 1$ .
- ▶ **Giant component condition** (or percolation condition):

$$\langle k \rangle_R = \frac{\langle k^2 \rangle - \langle k \rangle}{\langle k \rangle} > 1$$

- ▶ Again, see that the second moment is an essential part of the story.
- ▶ Equivalent statement:  $\langle k^2 \rangle > 2\langle k \rangle$

# Giant component

## Standard random networks:

- ▶ Recall  $\langle k^2 \rangle = \langle k \rangle^2 + \langle k \rangle$ .
- ▶ Condition for giant component:

$$\langle k \rangle_R = \frac{\langle k^2 \rangle - \langle k \rangle}{\langle k \rangle} = \frac{\langle k \rangle^2 + \langle k \rangle - \langle k \rangle}{\langle k \rangle} = \langle k \rangle$$

- ▶ Therefore when  $\langle k \rangle > 1$ , standard random networks have a giant component.
- ▶ When  $\langle k \rangle < 1$ , all components are finite.
- ▶ Fine example of a continuous phase transition (田).
- ▶ We say  $\langle k \rangle = 1$  marks the critical point of the system.

# Giant component

## Random networks with skewed $P_k$ :

- ▶ e.g, if  $P_k = ck^{-\gamma}$  with  $2 < \gamma < 3$ ,  $k \geq 1$ , then

$$\langle k^2 \rangle = c \sum_{k=1}^{\infty} k^2 k^{-\gamma}$$

$$\sim \int_{x=1}^{\infty} x^{2-\gamma} dx$$

$$\propto x^{3-\gamma} \Big|_{x=1}^{\infty} = \infty \quad (\gg \langle k \rangle).$$

- ▶ So giant component **always exists** for these kinds of networks.
- ▶ Cutoff scaling is  $k^{-3}$ : if  $\gamma > 3$  then we have to look harder at  $\langle k \rangle_R$ .
- ▶ How about  $P_k = \delta_{kk_0}$ ?

# Giant component

## And how big is the largest component?

- ▶ Define  $S_1$  as the **size of the largest component**.
- ▶ Consider an infinite ER random network with average degree  $\langle k \rangle$ .
- ▶ Let's find  $S_1$  with a back-of-the-envelope argument.
- ▶ Define  $\delta$  as the probability that a randomly chosen node **does not** belong to the largest component.
- ▶ Simple connection:  $\delta = 1 - S_1$ .
- ▶ **Dirty trick**: If a randomly chosen node is not part of the largest component, then none of its neighbors are.
- ▶ So

$$\delta = \sum_{k=0}^{\infty} P_k \delta^k$$

- ▶ Substitute in Poisson distribution...

# Giant component

- ▶ Carrying on:

$$\begin{aligned}\delta &= \sum_{k=0}^{\infty} P_k \delta^k = \sum_{k=0}^{\infty} \frac{\langle k \rangle^k}{k!} e^{-\langle k \rangle} \delta^k \\ &= e^{-\langle k \rangle} \sum_{k=0}^{\infty} \frac{(\langle k \rangle \delta)^k}{k!} \\ &= e^{-\langle k \rangle} e^{\langle k \rangle \delta} = e^{-\langle k \rangle (1-\delta)}.\end{aligned}$$

- ▶ Now substitute in  $\delta = 1 - S_1$  and rearrange to obtain:

$$S_1 = 1 - e^{-\langle k \rangle S_1}.$$

# Giant component

- ▶ We can figure out some limits and details for  $S_1 = 1 - e^{-\langle k \rangle S_1}$ .
- ▶ First, we can write  $\langle k \rangle$  in terms of  $S_1$ :

$$\langle k \rangle = \frac{1}{S_1} \ln \frac{1}{1 - S_1}.$$

- ▶ As  $\langle k \rangle \rightarrow 0$ ,  $S_1 \rightarrow 0$ .
- ▶ As  $\langle k \rangle \rightarrow \infty$ ,  $S_1 \rightarrow 1$ .
- ▶ Notice that at  $\langle k \rangle = 1$ , the critical point,  $S_1 = 0$ .
- ▶ Only solvable for  $S_1 > 0$  when  $\langle k \rangle > 1$ .
- ▶ Really a transcritical bifurcation. [2]

# Giant component

Turns out we were lucky...

- ▶ Our dirty trick **only works for** ER random networks.
- ▶ **The problem:** We assumed that neighbors have the same probability  $\delta$  of belonging to the largest component.
- ▶ But we know our friends are different from us...
- ▶ Works for ER random networks because  $\langle k \rangle = \langle k \rangle_R$ .
- ▶ We need a separate probability  $\delta'$  for the chance that an edge **leads to** the giant (infinite) component.
- ▶ We can sort many things out with **sensible probabilistic arguments...**
- ▶ More detailed investigations will profit from a spot of **Generatingfunctionology**.<sup>[3]</sup>
