## Social Contagion

### Examples abound

- ▶ fashion
- ▶ striking
- ▶ smoking (田)<sup>[6]</sup>
- ▶ residential segregation<sup>[16]</sup>
- ▶ ipods
- ▶ obesity (田)<sup>[5]</sup>
- ▶ Harry Potter
- ▶ voting
- ▶ gossip
- ▶ Rubik's cube 🎲
- ▶ religious beliefs
- ▶ leaving lectures

### SIR and SIRS contagion possible

- ▶ Classes of behavior versus specific behavior: **dieting**

## The general model of influence

Social Contagion

Social Contagion Models  
 Background  
 Granovetter's model  
 Network version  
 Groups  
 Chaos  
 References

### Two focuses for us

- ▶ Widespread media influence
- ▶ Word-of-mouth influence

### We need to understand influence

- ▶ Who influences whom? Very hard to measure...
- ▶ What kinds of influence response functions are there?
- ▶ Are some individuals super influencers? Highly popularized by Gladwell<sup>[9]</sup> as 'connectors'
- ▶ The infectious idea of opinion leaders (Katz and Lazarsfeld)<sup>[13]</sup>

## Social Contagion

### Why do things spread?

- ▶ Because of properties of special individuals?
- ▶ Or system level properties?
- ▶ Is the match that lights the fire important?
- ▶ Yes. But only because we are narrative-making machines...
- ▶ We like to think things happened for reasons...
- ▶ Reasons for success are usually ascribed to intrinsic properties (e.g., Mona Lisa)
- ▶ System/group properties harder to understand
- ▶ Always good to examine what is said before and after the fact...

## Getting others to do things for you

A very good book: ‘[Influence](#)’<sup>[7]</sup> by [Robert Cialdini](#) (田)

### Six modes of influence

1. **Reciprocation**: *The Old Give and Take... and Take*  
e.g., Free samples, Hare Krishnas.
2. **Commitment and Consistency**: *Hobgoblins of the Mind*  
e.g., Hazing.
3. **Social Proof**: *Truths Are Us*  
e.g., Catherine Genovese, Jonestown
4. **Liking**: *The Friendly Thief*  
Separation into groups is enough to cause problems.
5. **Authority**: *Directed Deference*  
Milgram's obedience to authority experiment.
6. **Scarcity**: *The Rule of the Few*  
Prohibition.

Social Contagion

## Social Contagion

### Some possible origins of thresholds:

- ▶ **Desire to coordinate**, to conform.
- ▶ **Lack of information**: impute the worth of a good or behavior based on degree of adoption (social proof)
- ▶ Economics: **Network effects** or **network externalities**
- ▶ Externalities = Effects on others not directly involved in a transaction
- ▶ Examples: telephones, fax machine, Facebook, operating systems
- ▶ An individual's utility increases with the adoption level among peers and the population in general

## Social Contagion

### Granovetter's Threshold model—definitions

- ▶  $\phi^*$  = threshold of an individual.
- ▶  $f(\phi_*)$  = distribution of thresholds in a population.
- ▶  $F(\phi_*)$  = cumulative distribution =  $\int_{\phi'_*=0}^{\phi_*} f(\phi'_*)d\phi'_*$
- ▶  $\phi_t$  = fraction of people 'rioting' at time step  $t$ .

## Social contagion models

### Thresholds

- ▶ Basic idea: individuals adopt a behavior when a **certain fraction of others** have adopted
- ▶ 'Others' may be everyone in a population, an individual's close friends, any reference group.
- ▶ Response can be probabilistic or deterministic.
- ▶ Individual thresholds can vary
- ▶ Assumption: order of others' adoption does not matter... (**unrealistic**).
- ▶ Assumption: level of influence per person is uniform (**unrealistic**).

Social Contagion

Social Contagion Models

Chaos

References

22 of 88

## Threshold models

- ▶ Example threshold influence response functions: **deterministic** and **stochastic**
- ▶  $\phi$  = fraction of contacts 'on' (e.g., rioting)
- ▶ Two states: S and I.

Social Contagion

Social Contagion Models

Background  
Granovetter's model  
Network version  
Groups  
Chaos

References

26 of 88

## Threshold models

- ▶ At time  $t + 1$ , fraction rioting = fraction with  $\phi_* \leq \phi_t$ .
- ▶ 
$$\phi_{t+1} = \int_0^{\phi_t} f(\phi_*) d\phi_* = F(\phi_*)|_0^{\phi_t} = F(\phi_t)$$
- ▶  $\Rightarrow$  Iterative maps of the unit interval  $[0, 1]$ .

Groups  
Chaos  
References

## Snowballing

The Cascade Condition:

1. If one individual is initially activated, what is the probability that an activation will spread over a network?
2. What features of a network determine whether a cascade will occur or not?

Social Contagion

Social Contagion Models  
Background  
Granovetter's model  
**Network version**  
Groups  
Chaos  
References

## Threshold model on a network

- ▶ Interactions between individuals now represented by a network
- ▶ Network is **sparse**
- ▶ Individual  $i$  has  $k_i$  contacts
- ▶ Influence on each link is **reciprocal** and of **unit weight**
- ▶ Each individual  $i$  has a fixed threshold  $\phi_i$
- ▶ Individuals repeatedly poll contacts on network
- ▶ Synchronous, discrete time updating
- ▶ Individual  $i$  becomes active when fraction of active contacts  $\frac{a_i}{k_i} \geq \phi_i$
- ▶ Individuals remain active when switched (no recovery = SI model)

Social Contagion

Social Contagion Models  
Background  
Granovetter's model  
**Network version**  
Groups  
Chaos  
References

## Snowballing

First study random networks:

- ▶ Start with  $N$  nodes with a degree distribution  $p_k$
- ▶ Nodes are randomly connected (carefully so)
- ▶ Aim: Figure out when activation will propagate
- ▶ Determine a **cascade condition**

Social Contagion

Social Contagion Models  
Background  
Granovetter's model  
**Network version**  
Groups  
Chaos  
References

## Threshold model on a network

- ▶ All nodes have threshold  $\phi = 0.2$ .

Social Contagion

Social Contagion Models

Granovetter's model  
**Network version**  
Groups  
Chaos  
References

## Snowballing

Follow active links

- ▶ An active link is a link connected to an activated node.
- ▶ If an infected link leads to **at least 1 more infected link**, then **activation spreads**.
- ▶ We need to understand which nodes can be activated when only one of their neighbors becomes active.

Social Contagion

Social Contagion Models  
Background  
Granovetter's model  
**Network version**  
Groups  
Chaos  
References

## The most gullible

### Vulnerables:

- ▶ We call individuals who can be activated by just one contact being active **vulnerables**
- ▶ The vulnerability condition for node  $i$ :

$$1/k_i \geq \phi_i$$

- ▶ Which means # contacts  $k_i \leq \lfloor 1/\phi_i \rfloor$
- ▶ For global cascades on random networks, must have a *global cluster of vulnerables* [20]
- ▶ **Cluster of vulnerables = critical mass**
- ▶ Network story: 1 node  $\rightarrow$  critical mass  $\rightarrow$  everyone.

Social Contagion

Social Contagion Models  
Background  
Granovetter's model  
Network version  
Groups  
Chaos  
References

## Cascade condition

### Putting things together:

- ▶ Expected number of active edges produced by an active edge:

$$R = \underbrace{\sum_{k=1}^{\infty} (k-1) \cdot \beta_k \cdot \frac{kP_k}{\langle k \rangle}}_{\text{success}} + \underbrace{0 \cdot (1 - \beta_k) \cdot \frac{kP_k}{\langle k \rangle}}_{\text{failure}}$$

$$= \sum_{k=1}^{\infty} (k-1) \cdot \beta_k \cdot \frac{kP_k}{\langle k \rangle}$$

Social Contagion

Social Contagion Models  
Background  
Granovetter's model  
Network version  
Groups  
Chaos  
References

## Cascade condition

### Back to following a link:

- ▶ A randomly chosen link, traversed in a random direction, leads to a degree  $k$  node with probability  $\propto kP_k$ .
- ▶ Follows from there being  $k$  ways to connect to a node with degree  $k$ .
- ▶ Normalization:

$$\sum_{k=0}^{\infty} kP_k = \langle k \rangle$$

- ▶ So

$$P(\text{linked node has degree } k) = \frac{kP_k}{\langle k \rangle}$$

Social Contagion

Social Contagion Models  
Background  
Granovetter's model  
Network version  
Groups  
Chaos  
References

## Cascade condition

So... for random networks with fixed degree distributions, cascades take off when:

$$\sum_{k=1}^{\infty} (k-1) \cdot \beta_k \cdot \frac{kP_k}{\langle k \rangle} \geq 1.$$

- ▶  $\beta_k$  = probability a degree  $k$  node is vulnerable.
- ▶  $P_k$  = probability a node has degree  $k$ .

Social Contagion

Social Contagion Models  
Background  
Granovetter's model  
Network version  
Groups  
Chaos  
References

## Cascade condition

### Next: Vulnerability of linked node

- ▶ Linked node is **vulnerable** with probability

$$\beta_k = \int_{\phi'_* = 0}^{1/k} f(\phi'_*) d\phi'_*$$

- ▶ If linked node is **vulnerable**, it produces  $k-1$  new outgoing active links
- ▶ If linked node is **not vulnerable**, it produces **no** active links.

Social Contagion

Social Contagion Models  
Background  
Granovetter's model  
Network version  
Groups  
Chaos  
References

## Cascade condition

### Two special cases:

- ▶ (1) Simple disease-like spreading succeeds:  $\beta_k = \beta$

$$\beta \cdot \sum_{k=1}^{\infty} (k-1) \cdot \frac{kP_k}{\langle k \rangle} \geq 1.$$

- ▶ (2) Giant component exists:  $\beta = 1$

$$1 \cdot \sum_{k=1}^{\infty} (k-1) \cdot \frac{kP_k}{\langle k \rangle} \geq 1.$$

Social Contagion

Social Contagion Models  
Background  
Granovetter's model  
Network version  
Groups  
Chaos  
References

## Cascades on random networks

- ▶ Cascades occur only if size of max vulnerable cluster  $> 0$ .
- ▶ System may be 'robust-yet-fragile'.
- ▶ 'Ignorance' facilitates spreading.

Social Contagion

Social Contagion Models  
Background  
Granovetter's model  
Network version  
Groups

References

## Cascade window—summary

For our simple model of a uniform threshold:

1. Low  $\langle k \rangle$ : No cascades in poorly connected networks. No global clusters of any kind.
2. High  $\langle k \rangle$ : Giant component exists but not enough vulnerables.
3. Intermediate  $\langle k \rangle$ : Global cluster of vulnerables exists. Cascades are possible in "Cascade window."

Social Contagion

69 of 88

## Social contagion

### Summary

- ▶ 'Influential vulnerables' are key to spread.
- ▶ Early adopters are mostly vulnerables.
- ▶ Vulnerable nodes important but not necessary.
- ▶ Groups may greatly facilitate spread.
- ▶ Seems that cascade condition is a global one.
- ▶ Most extreme/unexpected cascades occur in highly connected networks
- ▶ 'Influentials' are posterior constructs.
- ▶ Many potential influentials exist.

Social Contagion

70 of 88

## Social contagion

### Implications

- ▶ Focus on the influential vulnerables.
- ▶ Create entities that can be transmitted successfully through many individuals rather than broadcast from one 'influential.'
- ▶ Only simple ideas can spread by word-of-mouth. (Idea of opinion leaders spreads well...)
- ▶ Want enough individuals who will adopt and display.
- ▶ Displaying can be passive = free (yo-yo's, fashion), or active = harder to achieve (political messages).
- ▶ Entities can be novel or designed to combine with others, e.g. block another one.

## Chaotic behavior in coupled systems

Coupled maps are well explored (Kaneko/Kuramoto):

$$x_{i,n+1} = f(x_{i,n}) + \sum_{j \in \mathcal{N}_i} \delta_{i,j} f(x_{j,n})$$

►  $\mathcal{N}_i$  = neighborhood of node  $i$

1. Node states are **continuous**
2. Increase  $\delta$  and neighborhood size  $|\mathcal{N}|$   
⇒ **synchronization**

But for contagion model:

1. Node states are **binary**
2. **Asynchrony remains** as connectivity increases
