Geometric argument

Conclusion

# Law and Order, Special Science Edition: Truthicide Department

"In the scientific integrity system known as peer review, the people are represented by two highly overlapping yet equally important groups: the independent scientists who review papers and the scientists who punish those who publish garbage. This is one of their stories."

The PoCSverse Optimal Supply Networks II 6 of 125

Metabolism and Truthicide

Measuring exponents

River networks

Earlier theories

Geometric argument

Conclusion

## Animal power

Fundamental biological and ecological constraint:

 $P = c M^{\alpha}$ 

P =basal metabolic rate

M= organismal body mass

Does 1 elephant equal 1 million shrews in a elephant suit in a trenchcoat?

The PoCSverse Optimal Supply Networks II 7 of 125

Metabolism and Truthicide

Measuring exponents

River networks

Farlier theories

Geometric argument

$$P = c M^{\alpha}$$

#### Prefactor c depends on body plan and body temperature:

Birds	39–41 $^{\circ}C$
Eutherian Mammals	$3638^{\circ}C$
Marsupials	$3436^{\circ}C$
Monotremes	$30-31^{\circ}C$

The PoCSverse Optimal Supply Networks II 8 of 125

Metabolism and Truthicide

Death by fractions

Measuring exponents
River networks

Earlier theories

Geometric argument

Conclusion

## What one might expect:

 $\alpha = 2/3$  because ...

Dimensional analysis suggests an energy balance surface law:

$$P \propto S \propto V^{2/3} \propto M^{2/3}$$

Assumes isometric scaling (not quite the spherical cow).

& Lognormal fluctuations:

Gaussian fluctuations in  $\log_{10} P {\rm around} \log_{10} c M^{\alpha}.$ 

& Stefan-Boltzmann law of for radiated energy:

$$\frac{\mathrm{d}E}{\mathrm{d}t} = \sigma \varepsilon S T^4 \propto S$$

Conclusion

References

Most obvious concern:

3/4 - 2/3 = 1/12

An exponent higher than 2/3 points suggests a fundamental inefficiency in biology.

## Related putative scalings:

#### Wait! There's more!:

 $\red {
m \&}$  number of capillaries  $\propto M^{3/4}$ 

 $\red {
m \&}$  time to reproductive maturity  $\propto M^{1/4}$ 

 $\red{lambda}$  heart rate  $\propto M^{-1/4}$ 

 $\red {\sim}$  cross-sectional area of aorta  $\propto M^{3/4}$ 

 $\Leftrightarrow$  population density  $\propto M^{-3/4}$ 

The PoCSverse Optimal Supply Networks II 12 of 125

Metabolism and Truthicide Death by fractions

Measuring exponents

River networks

Farlier theories

Geometric argument

Conclusion

## The great 'law' of heartbeats:

#### Assuming:

 $\red{solution}$  Average heart rate  $\propto M^{-\beta}$ 

A Irrelevant but perhaps  $\beta = 1/4$ .

#### Then:

Average number of heart beats in a lifespan ≃ (Average lifespan) × (Average heart rate)  $\propto M^{\beta-\beta}$  $\propto M^0$ 

Number of heartbeats per life time is independent of organism size!

 $\Rightarrow$   $\approx$  1.5 billion ....

Conclusion

"A general scaling law reveals why the largest animals are not the fastest"

Hirt et al., Nature Ecology & Evolution, 1, 1116, 2017. [24]

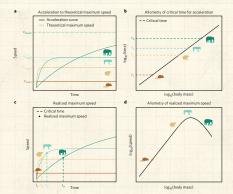

Figure 1 [Concept of time-dependent and mass-dependent realized maximum speed of animals, a Acceleration of animals follows a saturation (cold lines) appearing maximum speed (officed). The time saturation part of softent lines of spending on body mass (cold unce) appearing on body mass (cold unce) appearing on the cold lines) appearing on the cold lines of the cold lines of the cold lines are stated maximum speed (c), yielding a hump-shaped increase of animals maximum speed (c), yielding a hump-shaped increase of animals maximum speed (c).

The PoCSverse Optimal Supply Networks II 16 of 125

Metabolism and Truthicide

Death by fractions

Measuring exponents

River networks

Earlier theories

Geometric argumen

Conclusion

### Theoretical story:

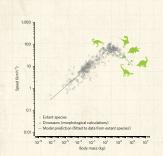

Figure 4 | Predicting the maximum speed of extinct species with the timedependent model. The model prediction (grey line) is fitted to data of extant species (grey circles) and extended to higher body masses. Speed data for dinosaurs (green triangles) come from detailed morphological model calculations (values in Table) and were not used to obtain model parameters.

- Maximum speed increases with size:  $v_{max} = aM^b$
- A Takes a while to get going:  $v(t) = v_{\text{max}}(1 e^{-kt})$
- $k \sim F_{\rm max}/M \sim c M^{d-1}$  Literature:  $0.75 \lesssim d \lesssim 0.94$
- Acceleration time = depletion time for anaerobic energy:  $\tau \sim f M^g$ Literature:  $0.76 \lesssim g \lesssim 1.27$

### Linear regression

#### Important:

Ordinary Least Squares (OLS) Linear regression is only appropriate for analyzing a dataset  $\{(x_i,y_i)\}$  when we know the  $x_i$  are measured without error.

 $\Leftrightarrow$  Here we assume that measurements of mass M have less error than measurements of metabolic rate B.

& Linear regression assumes Gaussian errors.

The PoCSverse Optimal Supply Networks II 30 of 125 Metabolism and

Truthicide

Death by fractions

Measuring exponents

River networks

Earlier theories

Geometric argument

Conclusion

### Measuring exponents

#### More on regression:

If (a) we don't know what the errors of either variable are, or (b) no variable can be considered independent, then we need to use Standardized Major Axis Linear Regression. [44, 42] (aka Reduced Major Axis = RMA.)

The PoCSverse Optimal Supply Networks II 31 of 125

Truthicide

Measuring exponents

River networks

Earlier theories

Geometric argument

Conclusion

## Measuring exponents

### For Standardized Major Axis Linear Regression:

 $slope_{SMA} = \frac{standard\ deviation\ of\ y\ data}{standard\ deviation\ of\ x\ data}$ 

- Wery simple!
- Minimization of sum of areas of triangles induced by vertical and horizontal residuals with best fit line.
- Attributed to Nobel Laureate economist Paul Samuelson , [44] but discovered independently by others.
- #somuchwin

The PoCSverse Optimal Supply Networks II 32 of 125

Truthicide

scatti by tractions

Measuring exponents

River networks

Earlier theories

Geometric argument

Conclusion

## Measuring exponents

Relationship to ordinary least squares regression is simple:

$$\operatorname{slope}_{\operatorname{SMA}} = r^{-1} \times \operatorname{slope}_{\operatorname{OLS} y \text{ on } x}$$
 $= r \times \operatorname{slope}_{\operatorname{OLS} x \text{ on } y}$ 

where r = standard correlation coefficient:

$$r = \frac{\sum_{i=1}^{n}(x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^{n}(x_i - \bar{x})^2}\sqrt{\sum_{i=1}^{n}(y_i - \bar{y})^2}}$$

Groovy upshot: If (1) a paper uses OLS regression when RMA would be appropriate, and (2) r is reported, we can figure out the RMA slope. [42, 30]

Metabolism and Truthicide

Death by fractions

Measuring exponents

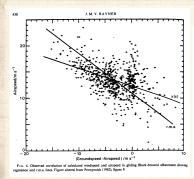

River networks

Earlier theories

Geometric argument

Conclusion

## Analysis of residuals

- 1. Presume an exponent of your choice: 2/3 or 3/4.
- 2. Fit the prefactor  $(\log_{10} c)$  and then examine the residuals:

$$r_i = \log_{10} B_i - (\alpha' \log_{10} M_i - \log_{10} c).$$

- 3.  $H_0$ : residuals are uncorrelated  $H_1$ : residuals are correlated.
- 4. Measure the correlations in the residuals and compute a *p*-value.

The PoCSverse Optimal Supply Networks II 41 of 125 Metabolism and

Truthicide

Death by fractions

#### Measuring exponents

River networks

Earlier theories

Geometric argument

Conclusion

## Analysis of residuals

We use the spiffing Spearman Rank-Order Correlation Coefficient

#### Basic idea:

 $\ref{Now}$  Now calculate correlation coefficient for ranks,  $r_s$ :

 $\textstyle\sum_{i=1}^n (R_i - \bar{R})(S_i - \bar{S})$ 

$$r_s = \frac{\sum_{i=1}^n (R_i - \bar{R})(S_i - S)}{\sqrt{\sum_{i=1}^n (R_i - \bar{R})^2} \sqrt{\sum_{i=1}^n (S_i - \bar{S})^2}}$$

 $\ \, \& \,$  Perfect correlation:  $x_i$  's and  $y_i$  's both increase monotonically.

Geometric argument

Conclusion

#### Sharks: "No."

#### The Geometric Scaling of Sharks

The biggest study of geometric scaling in large animals found that life follows math's rules. As a 3D object grows while maintaining its shape, its surface area scales as the two-thirds power of volume. This is also true for a diverse set of shark species.

"The geometry of life: Testing the scaling of whole-organism surface area and volume using sharks"

Conclusion

the data are in approximate order of hody sizes of organisms: Fishes (Yinca, Esox, Salmo, Pleuronectes flesus, Anguilla, Creniisbrus, Lubrus: 9.86 g-2 kg), Jan Boltrus (unpublished). Frogs (3.5-32 g), linards (3-13 g), Fay, 1914, p. 191. Rong exculente (23 and 50 g), Krosu, 1904, p. 404. Lizards (Luceria muralis and piridis, Aspais fragilis: 5-26 g) and Ringed Snake (47-100 g), Isana, 1911, pp. 7-8. Teuch (Times: 211 g), frog (44 g), rabbit (3.6 kg), Very, 1930, pp. 239, 244, 245. Dogs (7 and 30 kg), pigs, (3 and 160 kg), horses (175 and 190 kg), moreon (175 and 190 kg), monkeys (2.5 and 5.5 kg), man (6 and 65 kg), Baster, Convers and Marristwa, 1928, pp. 8, 30, 33 and 51. Stakes (ruttle-smake, small and lands nython, box: 8.5-32 kg), Disensert, 1932, p. 166. Rats (20 and 250 g), cattle (20 and 400 kg), Becov, 1945, pp. 360, 361. Giant shark (2.75 t), rhinoceres (1 t), Heassessess, 1950, pp. 30 and 43. Beech trees without leaves and roots (30 kg-1.3 t), Mallin, Nintson and Michael, 1954, tables 2-4 on pp. 277-281.

assuming a specific gravity of 1.0. Naturally, the inclination of this line corresponds to a proportionality power of 0.87.

Of the unicellular organisms represented in fig. 1 not a few are spherical in shape (the bacterium Sarcella, Saccharomyces, murine eggs); and most of the others have surfaces exceeding those of subcress of equal volume by rarely more than what correseconds to 0.1 decode in the log, ordinate system (Photoborterium phosphorescenz: 12 %, i. c. 0.05 decade, Escherichia coli: 34 %, i.e. 0.13 decade, the ciliates Colpidium and Paramaccium: 19-22 %, i. c. about 0.68-0.09 decade; calculated on the basis of data of Pürrez, 1924, table 7 on p. 108, and Harvey, 1928, table 1). Similar figures probably hold for other ciliates. Only the flagellates represented (Trypomosomidus, Astasia Riebsii) and certain amorbae are likely to deviate by higher figures. The surface values of the unicellular organisms represented in fig. 1 will, therefore, fall either on, or in most other cases less than 0.1 decade above, a line representing the relation between surface and volume of suberes.

It will be seen from fig. 10 that the points representing the hody surfaces of the metacoic minuals in question are grouped norallel to the sphere line; that is, also corresponding to a proportionality power of 0.67. An average line through the points would fall about 0.30 logarithmic decade above the sphere line, meaning that on the average the body surface is roughly 2 (antilog, 0.30) times higher in the animals under study than in soberry of rough weight or volume. In organisms of extreme shapes as the python (1045 g) and the beech trees (especially marked in fig. 3) the surface is about 3 and 10 times, respectively, greater than in a sphere of equal weight and volume. These facts agree well with the values 9-11.8 for the constant k in the

body surface in  $cm^2 = k \cdot body weight<sup>0.65</sup>$ 

as tabularized by Besonecy (1938, p. 175) for various birds and mammals weighing 8 g-14 kg; because this is about double the value of k for sphere surface (4.83). The value of k (18.95) found by Kabsus (1940) for Azcariz is 2.9 times 4.83, and this corresponds well with the above mentioned figure 3 for the much larger python of similar shape.

Measuring exponents

Earlier theories

Geometric argument

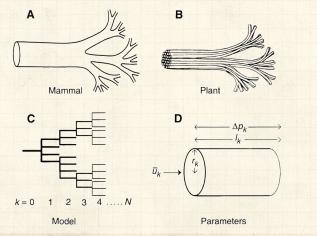

Conclusion

## Connecting network structure to $\alpha$

1. Ratios of network parameters:

$$R_n = \frac{n_{k+1}}{n_k}, \; R_\ell = \frac{\ell_{k+1}}{\ell_k}, \; R_r = \frac{r_{k+1}}{r_k}$$

Note:  $R_\ell, R_r < 1, \mbox{inverse of stream ordering definition.}$ 

2. Number of capillaries  $\propto P \propto M^{\alpha}$ .

$$\Rightarrow \boxed{\alpha = -\frac{\ln\!R_n}{\ln\!R_r^2R_\ell}}$$

(also problematic due to prefactor issues)

## Obliviously soldiering on, we could assert:

- $\Re$  space-fillingness:  $R_{\ell} = R_n^{-1/3}$

Geometric argument

Conclusion

#### Effecting scaling:

$$\Leftrightarrow$$
 Gives  $v \propto 1 - \ell^{-(2\epsilon - 1)} \rightarrow 1$  for large  $\ell$  if  $\epsilon > 1/2$ 

 $\red$  Previously, we looked at  $\epsilon = 0$  only.

Metabolism and Truthicide

Death by fractio

Measuring exponents

River networks

Farlier theories.

Geometric argument

Geometric angument

For  $0 \le \epsilon < 1/2$ , approximate network volume by integral over region:

$$\min V_{\rm net} \propto \int_{\Omega_{d,D}(V)} \rho \, ||\vec{x}||^{1-2\epsilon} \, \mathrm{d}\vec{x}$$

Insert assignment question

$$\propto 
ho V^{1+\gamma_{ ext{max}}(1-2\epsilon)}$$
 where  $\gamma_{ ext{max}} = \max_i \gamma_i.$ 

For  $\epsilon > 1/2$ , find simply that

$$\min V_{\rm net} \propto \rho V$$

So if supply lines can taper fast enough and without limit, minimum network volume can be made negligible.

The PoCSverse Optimal Supply Networks II 90 of 125

Metabolism and Truthicide

Death by fraction

Measuring exponents

River networks

Earlier theories

Geometric argument

Conclusion

For  $0 < \epsilon < 1/2$ :

$$\iff$$
  $\min V_{\mathrm{net}} \propto 
ho V^{1+\gamma_{\mathrm{max}}(1-2\epsilon)}$ 

$$\min V_{\rm net/iso} \propto \rho V^{1+(1-2\epsilon)/d}$$

 $\Leftrightarrow$  If scaling is allometric, we have  $\gamma_{\text{max}} = \gamma_{\text{allo}} > 1/d$ : and

$$\min V_{\rm net/allo} \propto \rho V^{1+(1-2\epsilon)\gamma_{\rm allo}}$$

Isometrically growing volumes require less network volume than allometrically growing volumes:

$$\frac{\min V_{\rm net/iso}}{\min V_{\rm net/allo}} \rightarrow 0$$
 as  $V \rightarrow \infty$ 

The PoCSverse Optimal Supply Networks II 91 of 125

Assume  $\rho$  is constant over time and  $\epsilon = 0$ :

$$V_{
m net} \propto 
ho V^{(d+1)/d} = {
m constant} imes V^{3/2}$$

Network volume grows faster than basin 'volume' (really area).

🙈 It's all okay:

Landscapes are d=2 surfaces living in D=3 dimensions.

🗞 Streams can grow not just in width but in depth ...

 $\Leftrightarrow$  If  $\epsilon > 0$ ,  $V_{\rm net}$  will grow more slowly but 3/2 appears to be confirmed from real data.

Conclusion

#### Hack's law

Flows sum in such a way that

$$V_{
m net} = \sum_{
m all\ pixels} a_{
m pixel\ \it i}$$

A Hack's law again:

$$\ell \sim a^h$$

名 Can argue

$$V_{\rm net} \propto V_{\rm basin}^{1+h} = a_{\rm basin}^{1+h}$$

where h is Hack's exponent.

$$h = 1/2$$

## Real data:

Banavar et al.'s approach <sup>[1]</sup> is okay because ρ really is constant.

The irony: shows optimal basins are isometric

 $lap{Optimal Hack's law:} \ell \sim a^h ext{ with } h = 1/2$ 

(Zzzzz)

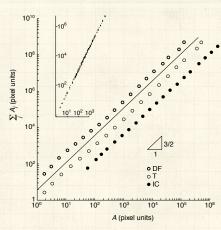

Figure 2 Allometric scaling in river networks. Double logarithmic plot of  $C \propto \Sigma_{\rm Ke}/A_{\rm X}$  versus A for three river networks characterized by different climates, geology and geographic locations (Dry Fork, West Virginia, 886 km², digital terrain map (DTM) size  $30 \times 30 \, {\rm m}^2$ ; Island Creek, Idaho, 260 km², DTM size  $30 \times 30 \, {\rm m}^2$ ; Tirso, Italy,  $2.024 \, {\rm km}^2$ , DTM size  $237 \times 237 \, {\rm m}^2$ ). The experimental points are obtained by binning total contributing areas, and computing the ensemble average of the sum of the inner areas for each sub-basin within the binned interval. The figure uses pixel units in which the smallest area element is assigned a unit value. Also plotted is the predicted scaling relationship with slope 3/2. The inset shows the raw data from the Tirso basin before any binning

#### Peter Sheridan Dodds, Theoretical Biology's Buzzkill By Mark Changizi | February 9th 2010 03:24 PM | 1 comment | Print | E E-mail | Track Comments

Search This Blog

There is an apocryphal story about a graduate mathematics student at the University of Virginia studying the properties of certain mathematical objects. In his fifth year some killjoy bastard elsewhere published a paper proving that there are no such mathematical objects. He dropped out of the program, and I never did hear where

he is today. He's probably making my cappuccino right now.

This week, a professor named Peter Sheridan Dodds published a new paper in *Physical Review Letters* further fleshing out a theory concerning why a 2/3 power law may apply for metabolic rate. The 2/3 law says that metabolic rate in animals rises as the 2/3 power of body mass. It was in a 2001 *Journal of Theoretical Biology* paper that he first argued that perhaps a 2/3 law applies, and that paper – along with others such as the one that just appeared — is what has put him in the Killjoy Hall of Fame. The University of Virginia's killiov was a mere amateur.

Conclusion

#### Conclusion

- Supply network story consistent with dimensional analysis.
- Isometrically growing regions can be more efficiently supplied than allometrically growing ones.
- Ambient and region dimensions matter (D = d versus D > d).
- Deviations from optimal scaling suggest inefficiency (e.g., gravity for organisms, geological boundaries).
- Actual details of branching networks not that important.
- & Exact nature of self-similarity varies.
- 2/3-scaling lives on, largely in hiding.
- 3/4-scaling? Jury ruled a mistrial.
- A The truth will out. Maybe.
