## Outline

### Lognormals

Empirical Confusability  
Random Multiplicative Growth Model  
Random Growth with Variable Lifespan

### References

## Alternative distributions

There are other 'heavy-tailed' distributions:

- 1. The Log-normal distribution (⊕)

$$P(x) = \frac{1}{x\sqrt{2\pi}\sigma} \exp\left(-\frac{(\ln x - \mu)^2}{2\sigma^2}\right)$$

- 2. Weibull distributions (⊕)

$$P(x)dx = \frac{k}{\lambda} \left(\frac{x}{\lambda}\right)^{\mu-1} e^{-(x/\lambda)^{\mu}} dx$$

CCDF = stretched exponential (⊕).

- 3. Gamma distributions (⊕), and more.

## lognormals

Lognormals and friends

Lognormals  
Empirical Confusability  
Random Multiplicative Growth Model  
Random Growth with Variable Lifespan  
References

### The lognormal distribution:

$$P(x) = \frac{1}{x\sqrt{2\pi}\sigma} \exp\left(-\frac{(\ln x - \mu)^2}{2\sigma^2}\right)$$

- In  $x$  is distributed according to a normal distribution with mean  $\mu$  and variance  $\sigma^2$ .
- Appears in economics and biology where growth increments are distributed normally.

1 of 23

## lognormals

Lognormals and friends

Lognormals  
Empirical Confusability  
Random Multiplicative Growth Model  
Random Growth with Variable Lifespan  
References

- Standard form reveals the mean  $\mu$  and variance  $\sigma^2$  of the underlying normal distribution:

$$P(x) = \frac{1}{x\sqrt{2\pi}\sigma} \exp\left(-\frac{(\ln x - \mu)^2}{2\sigma^2}\right)$$

- For lognormals:

$$\mu_{\text{lognormal}} = e^{\mu + \frac{1}{2}\sigma^2}, \quad \text{median}_{\text{lognormal}} = e^\mu,$$

$$\sigma_{\text{lognormal}} = (e^{\sigma^2} - 1)e^{2\mu + \sigma^2}, \quad \text{mode}_{\text{lognormal}} = e^{\mu - \sigma^2}.$$

- All moments of lognormals are finite.

## Derivation from a normal distribution

Lognormals and friends

Take  $Y$  as distributed normally:

- 

$$P(y)dy = \frac{1}{\sqrt{2\pi}\sigma} dy \exp\left(-\frac{(y - \mu)^2}{2\sigma^2}\right)$$

Set  $Y = \ln X$ :

- 

Transform according to  $P(x)dx = P(y)dy$ :

- 

$$\frac{dy}{dx} = 1/x \Rightarrow dy = dx/x$$

- 

$$\Rightarrow P(x)dx = \frac{1}{x\sqrt{2\pi}\sigma} \exp\left(-\frac{(\ln x - \mu)^2}{2\sigma^2}\right) dx$$

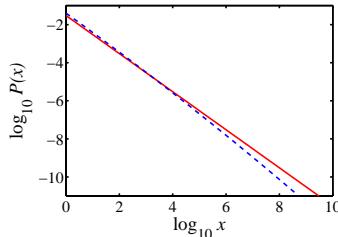

4 of 23

7 of 23

## Confusion between lognormals and pure power laws

Near agreement over four orders of magnitude!

- For lognormal (blue),  $\mu = 0$  and  $\sigma = 10$ .
- For power law (red),  $\gamma = 1$  and  $c = 0.03$ .

## Confusion

What's happening:

$$\begin{aligned} \ln P(x) &= \ln \left\{ \frac{1}{x\sqrt{2\pi}\sigma} \exp \left( -\frac{(\ln x - \mu)^2}{2\sigma^2} \right) \right\} \\ &= -\ln x - \ln \sqrt{2\pi} - \frac{(\ln x - \mu)^2}{2\sigma^2} \\ &= -\frac{1}{2\sigma^2} (\ln x)^2 + \left( \frac{\mu}{\sigma^2} - 1 \right) \ln x - \ln \sqrt{2\pi} - \frac{\mu^2}{2\sigma^2}. \\ \Rightarrow \text{If } \sigma^2 \gg 1 \text{ and } \mu, \\ \boxed{\ln P(x) \sim -\ln x + \text{const.}} \end{aligned}$$

## Confusion

- Expect -1 scaling to hold until  $(\ln x)^2$  term becomes significant compared to  $(\ln x)$ .
- This happens when (roughly)
- $$-\frac{1}{2\sigma^2} (\ln x)^2 \simeq 0.05 \left( \frac{\mu}{\sigma^2} - 1 \right) \ln x$$
- $$\Rightarrow \log_{10} x \lesssim 0.05 \times 2(\sigma^2 - \mu) \log_{10} e$$
- $$\simeq 0.05(\sigma^2 - \mu)$$
- $\Rightarrow$  If you find a -1 exponent, you may have a lognormal distribution...

## Generating lognormals:

Lognormals and friends

Lognormals  
Empirical Confusability  
Random Multiplicative Growth Model  
Random Growth with Variable Lifespan  
References

### Random multiplicative growth:

$$x_{n+1} = rx_n$$

where  $r > 0$  is a random growth variable

- (Shrinkage is allowed)
- In log space, growth is by addition:

$$\ln x_{n+1} = \ln r + \ln x_n$$

- $\Rightarrow \ln x_n$  is normally distributed
- $\Rightarrow x_n$  is lognormally distributed

## Lognormals or power laws?

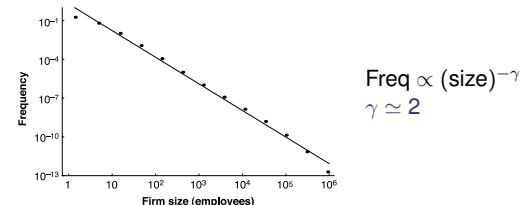

Lognormals and friends

Lognormals  
Empirical Confusability  
Random Multiplicative Growth Model  
Random Growth with Variable Lifespan  
References

- Gibrat [2] (1931) uses preceding argument to explain lognormal distribution of firm sizes ( $\gamma \simeq 1$ ).
- But Robert Axtell [1] (2001) shows a power law fits the data very well with  $\gamma = 2$ , not  $\gamma = 1$  (!)
- Problem of data censusing (missing small firms).

## An explanation

Lognormals and friends

Lognormals  
Empirical Confusability  
Random Multiplicative Growth Model  
Random Growth with Variable Lifespan  
References

- Axtel (mis?)cites Malcai et al.'s (1999) argument [5] for why power laws appear with exponent  $\gamma \simeq 2$
- The set up:  $N$  entities with size  $x_i(t)$
- Generally:

$$x_i(t+1) = rx_i(t)$$

where  $r$  is drawn from some happy distribution

- Same as for lognormal but one extra piece.
- Each  $x_i$  cannot drop too low with respect to the other sizes:

$$x_i(t+1) = \max(rx_i(t), c \langle x_i \rangle)$$

## An explanation

Some math later... Insert question from assignment

6 (田)

$$\text{Find } P(x) \sim x^{-\gamma}$$

- where  $\gamma$  is implicitly given by

$$N = \frac{(\gamma - 2)}{(\gamma - 1)} \left[ \frac{(c/N)^{\gamma-1} - 1}{(c/N)^{\gamma-1} - (c/N)} \right]$$

$N$  = total number of firms.

Now, if  $c/N \ll 1$ ,  $N = \frac{(\gamma - 2)}{(\gamma - 1)} \left[ \frac{-1}{-(c/N)} \right]$

Which gives  $\gamma \sim 1 + \frac{1}{1 - c}$

Groovy...  $c$  small  $\Rightarrow \gamma \approx 2$

References

## The second tweak

$$P(x) \propto x^{-1} e^{-\sqrt{2\lambda}(\ln x/m)^2}$$

- Depends on sign of  $\ln x/m$ , i.e., whether  $x/m > 1$  or  $x/m < 1$ .

$$P(x) \propto \begin{cases} x^{-1+\sqrt{2\lambda}} & \text{if } x/m < 1 \\ x^{-1-\sqrt{2\lambda}} & \text{if } x/m > 1 \end{cases}$$

'Break' in scaling (not uncommon)

Double-Pareto distribution (田)

First noticed by Montroll and Shlesinger [7, 8]

## The second tweak

### Ages of firms/people/... may not be the same

- Allow the number of updates for each size  $x_i$  to vary
- Example:  $P(t)dt = ae^{-at}dt$  where  $t$  = age.
- Back to no bottom limit: each  $x_i$  follows a lognormal
- Sizes are distributed as [6]

$$P(x) = \int_{t=0}^{\infty} ae^{-at} \frac{1}{x\sqrt{2\pi t}} \exp\left(-\frac{(\ln x - \mu)^2}{2t}\right) dt$$

(Assume for this example that  $\sigma \sim t$  and  $\mu = \ln m$ )

- Now averaging different lognormal distributions.

## Averaging lognormals

$$P(x) = \int_{t=0}^{\infty} ae^{-at} \frac{1}{x\sqrt{2\pi t}} \exp\left(-\frac{(\ln x/m)^2}{2t}\right) dt$$

- Insert question from assignment 6 (田)
- Some enjoyable suffering leads to:

$$P(x) \propto x^{-1} e^{-\sqrt{2\lambda}(\ln x/m)^2}$$
