Fundamental Theorem of Linear Algebra

Tofuspace 25/25:
Singular Value
Decomposition

- Applies to any $m \times n$ matrix A .
- Mirroring of A and A^T .

The Fundamental
Theorem of
Linear Algebra

Where \vec{x} lives:

- Row space $C(A^T) \subset R^n$.
- (Right) Nullspace $N(A) \subset R^n$.
- $\dim C(A^T) + \dim N(A) = r + (n - r) = n$
- Orthogonality: $C(A^T) \otimes N(A) = R^n$

Hubs and
Authorities

Approximating
matrices with SVD

Where \vec{b} lives:

- Column space $C(A) \subset R^m$.
- Left Nullspace $N(A^T) \subset R^m$.
- $\dim C(A) + \dim N(A^T) = r + (m - r) = m$
- Orthogonality: $C(A) \otimes N(A^T) = R^m$

Show me
the SVD!!

Best solution \vec{x}_* when $\vec{b} = \vec{p} + \vec{e}$:

Fundamental Theorem of Linear Algebra

Tofuspace 25/25:
Singular Value
Decomposition

Now we see:

-  Each of the four fundamental subspaces has a 'best' orthonormal basis
-  The \hat{v}_i span R^n
-  We find the \hat{v}_i as eigenvectors of $A^T A$.
-  The \hat{u}_i span R^m
-  We find the \hat{u}_i as eigenvectors of AA^T .

Approximating
matrices with SVD

Happy bases

-  $\{\hat{v}_1, \dots, \hat{v}_r\}$ span Row space
-  $\{\hat{v}_{r+1}, \dots, \hat{v}_n\}$ span Null space
-  $\{\hat{u}_1, \dots, \hat{u}_r\}$ span Column space
-  $\{\hat{u}_{r+1}, \dots, \hat{u}_m\}$ span Left Null space

Show me
the SVD!!

Fundamental Theorem of Linear Algebra

Tofuspace 25/25:
Singular Value
Decomposition

How $A\vec{x}$ works:

$$A\hat{v}_i = \sigma_i \hat{u}_i \quad \text{for } i = 1, \dots, r.$$

and

$$A\hat{v}_i = \hat{0} \quad \text{for } i = r + 1, \dots, n.$$

Matrix version:

$$A = U\Sigma V^T$$

A sends each $\hat{v}_i \in C(A^T)$ to its partner $\hat{u}_i \in C(A)$ with a positive stretch/shrink factor $\sigma_i > 0$.

A is diagonal with respect to these bases.

When viewed in the right way, every A is a diagonal matrix Σ .

Hubs and Authorities

Tofuspace 25/25:
Singular Value
Decomposition

 Idea: allow nodes in a knowledge network to have two attributes:

1. **Authority**: how much knowledge, information, etc., held by a node on a topic.
2. **Hubness (or Hubosity or Hubbishness or Hubtasticness)**: how well a node 'knows' where to find information on a given topic.

 Original work due to the legendary Jon Kleinberg.

 Best hubs point to best authorities.

 **Recursive**: Hubs authoritatively link to hubs, authorities hubbishly link to other authorities.

 **More**: look for dense links between sets of 'good' hubs pointing to sets of 'good' authorities.

 Known as the HITS algorithm 
(Hyperlink-Induced Topics Search).

Hubs and Authorities

Give each node two scores:

1. x_i = **authority score** for node i
2. y_i = **hubtasticness score** for node i

We connect the scores of neighboring nodes.

I: a good authority is linked to by good hubs.

Means x_i should **increase** as $\sum_{j=1}^N a_{ji} y_j$ **increases**.

Note: indices are ji meaning j has a directed link to i .

II: good hubs point to good authorities.

Means y_i should **increase** as $\sum_{j=1}^N a_{ij} x_j$ **increases**.

Linearity assumption:

$$\vec{x} \propto A^T \vec{y} \text{ and } \vec{y} \propto A \vec{x}$$

Show me
the SVD!!

 So let's say we have

$$\vec{x} = c_1 A^T \vec{y} \text{ and } \vec{y} = c_2 A \vec{x}$$

where c_1 and c_2 must be positive.

 Above equations combine to give

$$\vec{x} = c_1 A^T c_2 A \vec{x} = \lambda A^T A \vec{x}.$$

where $\lambda = c_1 c_2 > 0$.

 **It's all good:** we have the heart of singular value decomposition before us...

Approximating
matrices with SVD

Show me
the SVD!!

We can do this:

-  $A^T A$ is symmetric.
-  $A^T A$ is semi-positive definite so its eigenvalues are all ≥ 0 .
-  $A^T A$'s eigenvalues are the square of A 's singular values.
-  $A^T A$'s eigenvectors form a joyful orthogonal basis.
-  The splendid Perron-Frobenius theorem  tells us that only the dominant eigenvalue's eigenvector can be chosen to have non-negative entries.
-  So: linear assumption leads to a solvable system.
-  What would be very good: find networks where we have independent measures of node 'importance' and see how importance is actually distributed.

the SVD!!

Image approximation (80x60)

Idea: use SVD to approximate images

- Interpret elements of matrix A as color values of an image.
- Truncate series SVD representation of A :

$$A = U\Sigma V^T = \sum_{i=1}^r \sigma_i \hat{u}_i \hat{v}_i^T$$

- Use fact that $\sigma_1 \geq \sigma_2 \geq \dots \geq \sigma_r > 0$.
- Rank $r \leq \min(m, n)$.
- Rank $r \leq \#$ of pixels on shortest side.
- For color: approximate 3 matrices (RGB).

Show me
the SVD!!
