People thinking about people:

How are social networks structured?

- ▶ How do we define and measure connections?
- ▶ Methods/issues of self-report and remote sensing.

What about the dynamics of social networks?

- ▶ How do social networks/movements begin & evolve?
- ▶ How does collective problem solving work?
- ▶ How does information move through social networks?
- ▶ Which rules give the best 'game of society'?

Sociotechnical phenomena and algorithms:

- ▶ What can people and computers do together? (google)
- ▶ Use Play + Crunch to solve problems. Which problems?

## Social Search

A small slice of the pie:

- ▶ Q. Can people pass messages between distant individuals using only their existing social connections?
- ▶ A. Apparently yes...

## Milgram's social search experiment (1960s)

- ▶ Target person = Boston stockbroker.
- ▶ 296 senders from Boston and Omaha.
- ▶ 20% of senders reached target.
- ▶ chain length  $\approx 6.5$ .

### Popular terms:

- ▶ The Small World Phenomenon;
- ▶ "Six Degrees of Separation."

Social Search

Milgram's small world experiment with email:

"An Experimental study of Search in Global Social Networks"  
P. S. Dodds, R. Muhamad, and D. J. Watts,  
*Science*, Vol. 301, pp. 827–829, 2003. [6]

Social search—the Columbia experiment

- ▶ 60,000+ participants in 166 countries
- ▶ 18 targets in 13 countries including
  - ▶ a professor at an Ivy League university,
  - ▶ an archival inspector in Estonia,
  - ▶ a technology consultant in India,
  - ▶ a policeman in Australia, and
  - ▶ a veterinarian in the Norwegian army.
- ▶ 24,000+ chains

We were lucky and contagious (more later):

"Using E-Mail to Count Connections" , Sarah Milstein,  
New York Times, Circuits Section (December, 2001)

All targets:

Table S1									
Target	City	Country	Occupation	Gender	N	N (%)	r (ra)	<L>	
1	Novosibirsk	Russia	PhD student	F	8234	200(2.4)	64 (76)	4.08	
2	New York	USA	Writer	F	6044	31 (0.51)	65 (73)	3.61

Totals					98,847	384 (0.4)	63 (75)	4.08	

Social search—the Columbia experiment

- ▶ Milgram's participation rate was roughly 75%
- ▶ Email version: Approximately 37% participation rate.
- ▶ Probability of a chain of length 10 getting through:  
 $.37^{10} \simeq 5 \times 10^{-5}$
- ▶  $\Rightarrow$  384 completed chains (1.6% of all chains).

Social search—the Columbia experiment

- ▶ Motivation/Incentives/Perception matter.
- ▶ If target *seems* reachable  
 $\Rightarrow$  participation more likely.
- ▶ Small changes in attrition rates  
 $\Rightarrow$  large changes in completion rates
- ▶ e.g.,  $\searrow$  15% in attrition rate  
 $\Rightarrow$   $\nearrow$  800% in completion rate

Social search—the Columbia experiment

Comparing successful to unsuccessful chains:

- ▶ Successful chains used relatively weaker ties:

## Social search—the Columbia experiment

### Successful chains disproportionately used:

- ▶ Weak ties, Granovetter<sup>[7]</sup>
- ▶ Professional ties (34% vs. 13%)
- ▶ Ties originating at work/college
- ▶ Target's work (65% vs. 40%)

### ...and disproportionately avoided

- ▶ hubs (8% vs. 1%) (+ no evidence of funnels)
- ▶ family/friendship ties (60% vs. 83%)

### Geography → Work

## Social search—the Columbia experiment

### Basic results:

- ▶  $\langle L \rangle = 4.05$  for all completed chains
- ▶  $L_*$  = Estimated 'true' median chain length (zero attrition)
- ▶ Intra-country chains:  $L_* = 5$
- ▶ Inter-country chains:  $L_* = 7$
- ▶ All chains:  $L_* = 7$
- ▶ Milgram:  $L_* \approx 9$

## Social search—the Columbia experiment

### Senders of successful messages showed little absolute dependency on

- ▶ age, gender
- ▶ country of residence
- ▶ income
- ▶ religion
- ▶ relationship to recipient

Range of completion rates for subpopulations:  
30% to 40%

## Usefulness:

### Harnessing social search:

- ▶ Can distributed social search be used for something big/good?
- ▶ What about something evil? (Good idea to check.)
- ▶ What about socio-inspired algorithms for information search? (More later.)
- ▶ For real social search, we have an incentives problem.
- ▶ Which kind of influence mechanisms/algorithms would help propagate search?
- ▶ Fun, money, prestige, ... ?
- ▶ Must be 'non-gameable.'

## Social search—the Columbia experiment

### Mildly bad for continuing chain:

choosing recipients because "they have lots of friends" or because they will "likely continue the chain."

### Why:

- ▶ Specificity important
- ▶ Successful links used relevant information. (e.g. connecting to someone who shares same profession as target.)

## Red balloons:

### A Grand Challenge:

- ▶ 1969: The Internet is born<sup>[8]</sup> (the ARPANET<sup>[9]</sup>—four nodes!).
- ▶ Originally funded by DARPA who created a grand Network Challenge<sup>[10]</sup> for the 40th anniversary.
- ▶ Saturday December 5, 2009: DARPA puts 10 red weather balloons up during the day.
- ▶ Each 8 foot diameter balloon is anchored to the ground somewhere in the United States.
- ▶ Challenge: Find the latitude and longitude of each balloon.
- ▶ Prize: \$40,000.

\*DARPA = Defense Advanced Research Projects Agency<sup>[11]</sup>.

## Collective Detective:

### ► Finding an errant panda

Once again, social media proved to be a powerful dragnet. Around 1:15 p.m., a Washingtonian posted a picture on Twitter of Rusty in a patch of weeds in the Adams Morgan district, not far from the 165-acre zoo, which was created in 1889 by an act of Congress. "Red panda in our neighborhood," wrote Ashley Faughly, who identified herself as a singer, actress and traveler. "Please come save him!"

Another neighbor posted a photograph of two zoo workers, one in safari shorts standing on a rooftop, one holding a giant butterfly net. Soon the zoo announced: "Rusty the red panda has been recovered, crated & is headed safely back to the National Zoo!"

### ► Nature News: "Crowdsourcing in manhunts can work: Despite mistakes over the Boston bombers, social media can help to find people quickly" by Philip Ball (April 26, 2013)

## Finding red balloons:

### The winning team and strategy:

- MIT's Media Lab won in less than 9 hours. [9]
- Pickard et al. "Time-Critical Social Mobilization," [9] Science Magazine, 2011.
- People were virally recruited online to help out.
- Idea: Want people to both (1) find the balloons, and (2) involve more people.
- Recursive incentive structure with exponentially decaying payout:
  - \$2000 for correctly reporting the coordinates of a balloon.
  - \$1000 for recruiting a person who finds a balloon.
  - \$500 for recruiting a person who recruits the balloon finder, ...
  - (Not a Ponzi scheme.)
- True victory: [Colbert interviews Riley Crane](#)

## Finding balloons:

### Clever scheme:

- Max payout = \$4000 per balloon.
- Individuals have clear incentives to both
  1. involve/source more people (spread), and
  2. find balloons (goal action).
- Gameable?
- Limit to how much money a set of bad actors can extract.

### Extra notes:

- MIT's brand helped greatly.
- MIT group first heard about the competition a few days before. **Ouch.**
- A number of other teams did well.
- Worthwhile looking at these competing strategies. [9]

## The social world appears to be small... why?

### Theory: how do we understand the small world property?

- Connected random networks have short average path lengths:

$$\langle d_{AB} \rangle \sim \log(N)$$

$N$  = population size,

$d_{AB}$  = distance between nodes  $A$  and  $B$ .

- But: social networks aren't random...

PoCS | @pocsvox

UNIVERSITY OF VERMONT  
33 of 68

## Small-world networks

Introduced by Watts and Strogatz (Nature, 1998)<sup>[14]</sup>  
"Collective dynamics of 'small-world' networks."

Small-world networks were found everywhere:

- neural network of C. elegans,
- semantic networks of languages,
- actor collaboration graph,
- food webs,
- social networks of comic book characters,...

Very weak requirements:

- local regularity + random short cuts

PoCS | @pocsvox  
Small-world networks

Small-world networks  
Experiments  
Theory  
Generalized affiliation networks  
Nutshell  
References

UNIVERSITY OF VERMONT  
36 of 68

## Non-randomness gives clustering:

$d_{AB} = 10 \rightarrow$  too many long paths.

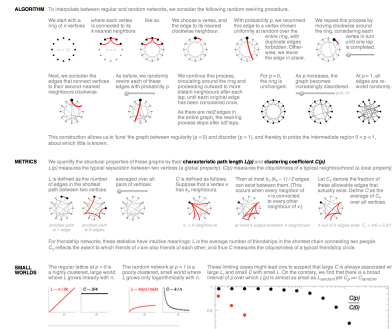

PoCS | @pocsvox  
Small-world networks

Small-world networks  
Experiments  
Theory  
Generalized affiliation networks  
Nutshell

## Previous work—finding short paths

But are these short cuts findable?

Nope. [8]

Nodes **cannot** find each other quickly with any local search method.

Need a more sophisticated model...

PoCS | @pocsvox

UNIVERSITY OF VERMONT  
39 of 68

## Previous work—finding short paths

### Kleinberg's Network:

1. Start with regular d-dimensional cubic lattice.
2. Add local links so nodes know all nodes within a distance  $q$ .
3. Add  $m$  short cuts per node.
4. Connect  $i$  to  $j$  with probability

$$p_{ij} \propto x_{ij}^{-\alpha}.$$

- ▶  $\alpha = 0$ : random connections.
- ▶  $\alpha$  large: reinforce local connections.
- ▶  $\alpha = d$ : connections grow logarithmically in space.

## Previous work—finding short paths

### Theoretical optimal search:

- ▶ "Greedy" algorithm.
- ▶ Number of connections grow logarithmically (slowly) in space:  $\alpha = d$ .
- ▶ Social golf.

Search time grows slowly with system size (like  $\log^2 N$ ).

But: social networks aren't lattices plus links.

## Models

One approach: incorporate **identity**.

Identity is formed from attributes such as:

- Geographic location
- Type of employment
- Religious beliefs
- Recreational activities.

**Groups** are formed by people with at least one similar attribute.

Attributes  $\Leftrightarrow$  Contexts  $\Leftrightarrow$  Interactions  $\Leftrightarrow$  Networks.

PoCS | @pocsvox  
Small-world networks

Small-world networks

## Models

Distance between two individuals  $x_{ij}$  is the height of lowest common ancestor.

$$x_{ij} = 3, x_{ik} = 1, x_{iv} = 4.$$

PoCS | @pocsvox  
Small-world networks

Small-world networks  
Experiments  
Theory  
Generalized affiliation networks  
Nutshell  
References

UNIVERSITY OF VERMONT  
51 of 68

Models

- Individuals are more likely to know each other the closer they are within a hierarchy.
- Construct  $z$  connections for each node using

$$p_{ij} = c \exp\{-\alpha x_{ij}\}.$$

- $\alpha = 0$ : random connections.
- $\alpha$  large: local connections.

The model

Triangle inequality doesn't hold:

$$y_{ik} = 4 > y_{ij} + y_{jk} = 1 + 1 = 2.$$

Models

Generalized affiliation networks

- Blau & Schwartz [2], Simmel [11], Breiger [3], Watts *et al.* [13]; see also Google+ Circles.

The model

- Individuals know the identity vectors of
  - themselves,
  - their friends, and
  - the target.
- Individuals can estimate the social distance between their friends and the target.
- Use a greedy algorithm + allow searches to fail randomly.

The model

$$\vec{v}_i = [1 \ 1 \ 1]^T, \vec{v}_j = [8 \ 4 \ 1]^T$$
$$x_{ij}^1 = 4, x_{ij}^2 = 3, x_{ij}^3 = 1.$$

Social distance:  
$$y_{ij} = \min_h x_{ij}^h.$$

The model-results—searchable networks

$q$  = probability an arbitrary message chain reaches a target.

- A few dimensions help.
- Searchability decreases as population increases.
- Precise form of hierarchy largely doesn't matter.

## The model-results

Milgram's Nebraska-Boston data:

Model parameters:

- ▶  $N = 10^8$ ,
- ▶  $z = 300, g = 100$ ,
- ▶  $b = 10$ ,
- ▶  $\alpha = 1, H = 2$ ;
- ▶  $\langle L_{\text{model}} \rangle \simeq 6.7$
- ▶  $L_{\text{data}} \simeq 6.5$

## Social Search—Real world uses

Recommender systems:

- ▶ Amazon uses people's actions to build effective connections between books.
- ▶ Conflict between 'expert judgments' and tagging of the hoi polloi.

## Social search—Data

Adamic and Adar (2003)

- ▶ For HP Labs, found probability of connection as function of organization distance well fit by exponential distribution.
- ▶ Probability of connection as function of real distance  $\propto 1/r$ .

Nutshell for Small-World Networks:

- ▶ Bare networks are typically unsearchable.
- ▶ Paths are findable if nodes understand how network is formed.
- ▶ Importance of identity (interaction contexts).
- ▶ Improved social network models.
- ▶ Construction of peer-to-peer networks.
- ▶ Construction of searchable information databases.

## Social Search—Real world uses

- ▶ Tags create identities for objects
- ▶ Website tagging: [bitly.com](http://bitly.com)
- ▶ (e.g., Wikipedia)
- ▶ Photo tagging: [flickr.com](http://flickr.com)
- ▶ Dynamic creation of metadata plus links between information objects.
- ▶ Folksonomy: collaborative creation of metadata
