# No really, that's a lot of data

## Data inflation

2

Unit	Size	What it means
Bit (b)	1 or 0	Short for "binary digit", after the binary code (1 or 0) computers use to store and process data
Byte (B)	8 bits	Enough information to create an English letter or number in computer code. It is the basic unit of computing
Kilobyte (KB)	1,000, or $2^{10}$ , bytes	From "thousand" in Greek. One page of typed text is 2KB
Megabyte (MB)	1,000KB; $2^{20}$ bytes	From "large" in Greek. The complete works of Shakespeare total 5MB. A typical pop song is about 4MB
Gigabyte (GB)	1,000MB; $2^{30}$ bytes	From "giant" in Greek. A two-hour film can be compressed into 1-2GB
Terabyte (TB)	1,000GB; $2^{40}$ bytes	From "monster" in Greek. All the catalogued books in America's Library of Congress total 15TB
Petabyte (PB)	1,000TB; $2^{50}$ bytes	All letters delivered by America's postal service this year will amount to around 5PB. Google processes around 1PB every hour
Exabyte (EB)	1,000PB; $2^{60}$ bytes	Equivalent to 10 billion copies of <i>The Economist</i>
Zettabyte (ZB)	1,000EB; $2^{70}$ bytes	The total amount of information in existence this year is forecast to be around 1.2ZB
Yottabyte (YB)	1,000ZB; $2^{80}$ bytes	Currently too big to imagine

Source: *The Economist*

The prefixes are set by an intergovernmental group, the International Bureau of Weights and Measures. Yotta and Zetta were added in 1991; terms for larger amounts have yet to be established.

## Wikipedia, 2016:

In philosophy, systems theory, science, and art, emergence is a process whereby larger entities arise through interactions among smaller or simpler entities such that the larger entities exhibit properties the smaller/simpler entities do not exhibit.

The philosopher G. H. Lewes first used the word explicitly in 1875.

# Emergence:

## The Wikipedia on Emergence (2006):

"In philosophy, systems theory and the sciences, emergence refers to the way complex systems and patterns arise out of a multiplicity of relatively simple interactions. ... emergence is central to the physics of complex systems and yet very controversial."

Listen to Steve Strogatz, Hod Lipson, and Michael Schmidt (Cornell) in the last piece [↗](#) (11:16) on Radiolab's show 'Limits' [↗](#) (April 5, 2010).

(El Bibliomata/flickr)

**Dr. Steve Strogatz** wonders if we've reached the limits of human scientific understanding, and should soon turn the reins of research over to robots. Cold, calculating robots. Then, **Dr. Hod Lipson** and **Michael Schmidt** walk us through the workings of a revolutionary computer program that they developed—a program that can deduce mathematical relationships in nature, through simple observation. The catch? As **Dr. Gurot Suel** explains, the program gives answers to complex biological questions that we humans have yet to ask, or even to understand.

“Self-organization  is a process in which the internal organization of a system, normally an open system, increases in complexity without being guided or managed by an outside source.” (also: Self-assembly)

## Examples:

-  Molecules/Atoms liking each other →  
Gases, liquids, and solids.
-  Spin alignment → Magnetization.
-  Protein folding.
-  Imitation → Herding, flocking, mobs, ...

## A Study of Cat Lapping

Adult cats and dogs are unable to create suction in their mouths and must use their tongues to drink. A dog will scoop up liquid with the back of its tongue, but a cat will only touch the surface with the smooth tip of its tongue and pull a column of liquid into its mouth.

Amusing interview here ↗

## Another great, great moment in scaling:

$$f \sim M^{-1/6}$$

The balance of inertia and gravity yields a prediction for the lapping frequency of other felines. Assuming isometry within the Felidae family (i.e., that lapping height  $H$  scales linearly with tongue width  $R$  and animal mass  $M$  scales as  $R^3$ ), the finding that  $Fr^*$  is of order one translates to the prediction  $f \sim R^{-1/2} \sim M^{-1/6}$ . Isometry or marginally positive allometry among the Felidae has been demonstrated for skull (20, 21) and limb bones (22). Although variability by function can lead to departures from isometry in interspecific scalings (23), reported variations within the Felidae (23, 24) only minimally affect the predicted scaling  $f \sim M^{-1/6}$ . We tested this  $-1/6$  power-law dependence by measuring the lapping frequency for eight species of felines, from videos acquired at the Zoo New England or available on YouTube (16). The lapping frequency was observed to decrease with animal mass as  $f = 4.6 M^{-0.181 \pm 0.024}$  ( $f$  in  $s^{-1}$ ,  $M$  in kg) (Fig. 4C), close to the predicted  $M^{-1/6}$ . This close agreement suggests that the domestic cat's inertia- and gravity-controlled lapping mechanism is conserved among felines.

Snared from Michael Gastner's page on percolation [no

# The Ising Model of a ferromagnet:

Each atom is assumed to have a local spin that can be **up** or **down**:  
 $S_i = \pm 1$ .

Spins are assumed to be arranged on a lattice.

In isolation, spins like to align with each other.

Increasing temperature breaks these alignments.

The *drosophila* of statistical mechanics.

Criticality: Power-law distributions at critical points.
