Properties of Complex Networks

Properties of Complex Networks

- Assortativity
- Motifs
- Concurrency Branching ratios
- Interconnectedness

Nutshell

A notable feature of large-scale networks:

🙈 Graphical renderings are often just a big mess.

← Typical hairball

- \bigcirc number of nodes N = 500
- \bigcirc number of edges m = 1000
- ightharpoonup average degree $\langle k \rangle$ = 4

And even when renderings somehow look good: "That is a very graphic analogy which aids understanding wonderfully while being, strictly speaking, wrong in every possible way" said Ponder [Stibbons] —Making Money, T. Pratchett.

We need to extract digestible, meaningful aspects.

Some key aspects of real complex networks:

& degree distribution*

assortativity

A homophily

clustering

motifs

modularity

concurrency

hierarchical scaling

network distances

centrality

efficiency

interconnectedness

robustness

Plus coevolution of network structure and processes on networks.

 Degree distribution is the elephant in the room that we are now all very aware of...

Properties of Complex Networks

A problem

Networks

Degree distributions

Concurrency

Interconnectedness

1. degree distribution P_k

 $\begin{cases} \& P_k \end{cases}$ is the probability that a randomly selected node has degree k.

& k = node degree = number of connections.

ex 1: Erdős-Rényi random networks have Poisson degree distributions:

Insert question from assignment 7 🗷

$$P_k = e^{-\langle k \rangle} \frac{\langle k \rangle^k}{k!}$$

 \Leftrightarrow ex 2: "Scale-free" networks: $P_k \propto k^{-\gamma} \Rightarrow$ 'hubs'.

link cost controls skew.

hubs may facilitate or impede contagion.

Network distances
Interconnectedness

Nutshell

Note:

- Erdős-Rényi random networks are a mathematical construct.
- 'Scale-free' networks are growing networks that form according to a plausible mechanism.
- Randomness is out there, just not to the degree of a completely random network.

2. Assortativity/3. Homophily:

Social networks: Homophily 🗹 = birds of a feather

Assortativity

e.g., degree is standard property for sorting: measure degree-degree correlations.

Concurrency Interconnectedness

Assortative network: [5] similar degree nodes connecting to each other. Often social: company directors, coauthors, actors.

Nutshell References

Disassortative network: high degree nodes connecting to low degree nodes. Often techological or biological: Internet, WWW, protein interactions, neural networks, food webs.

Local socialness:

4. Clustering:

- Your friends tend to know each other.
- Two measures (explained) on following slides):
 - 1. Watts & Strogatz [8]

$$C_1 = \left\langle \frac{\sum_{j_1 j_2 \in N_i} a_{j_1 j_2}}{k_i (k_i - 1)/2} \right\rangle_i$$

2. Newman [6]

$$C_2 = rac{3 imes ext{\#triangles}}{ ext{\#triples}}$$

PoCS | @pocsvox

Properties of Complex Networks

Properties of Complex Networks

Clustering

Concurrency

Interconnectedness

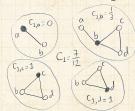

Example network:

Calculation of C_1 :

& C_1 is the average fraction of pairs of neighbors who are connected.

Fraction of pairs of neighbors who are connected is

$$\frac{\sum_{j_1 j_2 \in N_i} a_{j_1 j_2}}{k_i (k_i - 1)/2}$$

where k_i is node i's degree, and N_i is the set of i's neighbors.

Averaging over all nodes, we have:

$$C_1 = \frac{1}{n} \sum_{i=1}^{n} \frac{\sum_{j_1 j_2 \in N_i} a_{j_1 j_2}}{k_i (k_i - 1)/2} = \left\langle \frac{\sum_{j_1 j_2 \in N_i} a_{j_1 j_2}}{k_i (k_i - 1)/2} \right\rangle_i$$

Triples and triangles

Example network:

Triangles:

Triples:

- Nodes i_1 , i_2 , and i_3 form a triple around i_1 if i_1 is connected to i_2 and i_3 .
- Nodes i_1 , i_2 , and i_3 form a triangle if each pair of nodes is connected
- $\text{The definition } C_2 = \frac{3 \times \text{\#triangles}}{\text{\#triples}}$ measures the fraction of closed triples
- The '3' appears because for each triangle, we have 3 closed triples.
- Social Network Analysis (SNA): fraction of transitive triples.

PoCS | @pocsvox

Properties of Complex Networks

Degree distributions

Clustering

Concurrency
Branching ratios
Network distances
Interconnectedness

Clustering:

Sneaky counting for undirected, unweighted networks:

 $\red{\$}$ If the path i-j- ℓ exists then $a_{ij}a_{j\ell}=1$.

 \Leftrightarrow We want $i \neq \ell$ for good triples.

In general, a path of n edges between nodes i_1 and i_n travelling through nodes $i_2, i_3, ... i_{n-1}$ exists $\Leftrightarrow a_{i_1 i_2} a_{i_2 i_3} a_{i_3 i_4} \cdots a_{i_{n-2} i_{n-1}} a_{i_{n-1} i_n} = 1$.

$$\#\mathsf{triples} = \frac{1}{2} \left(\sum_{i=1}^{N} \sum_{\ell=1}^{N} \left[A^2 \right]_{i\ell} - \mathsf{Tr} A^2 \right)$$

#triangles =
$$\frac{1}{6}$$
Tr A^3

Network distances
Interconnectedness

Nutshell

For sparse networks, C_1 tends to discount highly connected nodes.

 $\stackrel{ ext{left}}{\Leftrightarrow} C_2$ is a useful and often preferred variant

 \clubsuit In general, $C_1 \neq C_2$.

 \mathcal{L}_1 is a global average of a local ratio.

7. concurrency:

- transmission of a contagious element only occurs during contact
- rather obvious but easily missed in a simple model
- dynamic property—static networks are not enough
- knowledge of previous contacts crucial
- beware cumulated network data
- Kretzschmar and Morris, 1996 [4]
- "Temporal networks" become a concrete area of study for Piranha Physicus in 2013.

Properties of Complex Networks

Concurrency Interconnectedness

8. Horton-Strahler ratios:

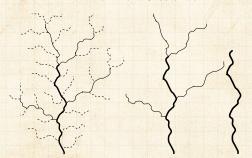

Method for ordering streams hierarchically

Number: $R_n = N_{\omega}/N_{\omega+1}$

Segment length: $R_l = \langle l_{\omega+1} \rangle / \langle l_{\omega} \rangle$

ightharpoonup Area/Volume: $R_a = \langle a_{\omega+1} \rangle / \langle a_{\omega} \rangle$

PoCS | @pocsvox

Properties of Complex Networks

Concurrency Branching ratios

Interconnectedness

9. network distances:

(a) shortest path length d_{ij} :

 \Leftrightarrow Fewest number of steps between nodes i and j.

(Also called the chemical distance between i and j.)

(b) average path length $\langle d_{ij} \rangle$:

Average shortest path length in whole network.

Good algorithms exist for calculation.

Weighted links can be accommodated.

9. network distances:

network diameter d_{max}: Maximum shortest path length between any two nodes.

Closeness handles disconnected networks $(d_{ij} = \infty)$

 $d_{cl} = \infty$ only when all nodes are isolated.

Closeness perhaps compresses too much into one number

10. centrality:

- Many such measures of a node's 'importance.'
- \Leftrightarrow ex 1: Degree centrality: k_i .
- \approx ex 2: Node *i*'s betweenness = fraction of shortest paths that pass through *i*.
- \Leftrightarrow ex 3: Edge ℓ 's betweenness = fraction of shortest paths that travel along ℓ .
- & ex 4: Recursive centrality: Hubs and Authorities (Jon Kleinberg [3])

Network distances Interconnectedness

Interconnected networks and robustness (two for one deal):

"Catastrophic cascade of failures in interdependent networks" [1]. Buldyrev et al., Nature 2010.

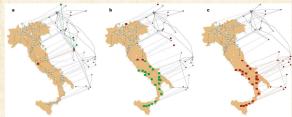

Figure 1 [Modelling a blackout in laby. Illustration of an iterative process of a cascade of failures using real-world date from a power network (located on the map of that); and an internet network (shifted above the map) that were 2009. The networks are drawn using the real goographical locations and every Internet server is connected to the geographically nearest power station. A One power station is removed (red node on map J from the power network and na a result the Internet nodes depending on it are removed from disconnected from the saint cluster is cauter that some there were the disconnected from the saint cluster is cauter that some there were the disconnected from the saint cluster is cauter that some there were the removed from

at the next step are marked in green. b. Additional nodes that were disconnected from the Internet communication network gainst component are removed (red nodes above map). As a result the power stations depending on them are removed from the power network (red nodes on map). Again, the nodes that will be disconnected from the gain cluster at the original content of the power network (red nodes on map). Again, the nodes that will be disconnected from the gain cluster at the form the gainst component of the power network are removed (red nodes on map) as well as the nodes in the Internet network that depend on them (red nodes above map).

Interconnectedness

Nutshell

Nutshell:

Overview Key Points:

- A The field of complex networks came into existence in the late 1990s.
- Explosion of papers and interest since 1998/99.
- Hardened up much thinking about complex systems.
- Specific focus on networks that are large-scale, sparse, natural or man-made, evolving and dynamic, and (crucially) measurable.
- Three main (blurred) categories:
 - 1. Physical (e.g., river networks).
 - 2. Interactional (e.g., social networks),
 - 3. Abstract (e.g., thesauri).
