-  Highly skewed distributions again...

Rosen's theory:

 Individual quality q maps to reward $R(q)$.

 $R(q)$ is 'convex' ($d^2 R/dq^2 > 0$).

 Two reasons:

1. Imperfect substitutability

2. Technology

 Joint consumption versus public good.

 No social element—success follows 'inherent quality'.

Winning: it's not
for everyone

"Consumption capital": "Appreciation [of music] increases with knowledge. But how does one know about music? By listening to it, *and discussing it with other persons who know about it.*"

Assumes extreme case of equal "inherent quality"

Argues desire for coordination in knowledge and culture leads to differential success

Success can be purely a social construction

(How can we measure 'inherent quality?')

Evidence from the web suggestions (Huberman et al.)

1. Easy decisions (yes/no) lead to bandwagoning

 e.g. jyte.com

2. More costly evaluations lead to oppositional votes

 e.g. amazon.com

 **Self-selection:** Costly voting may lower incentives for those who agree with the current assessment and increase incentives for those who disagree.

Inequality as measured by Gini coefficient:

$$G = \frac{1}{(2N_s - 1)} \sum_{i=1}^{N_s} \sum_{j=1}^{N_s} |m_i - m_j|$$

Winning: it's not

References

Unpredictability

$$U = \frac{1}{N_s \binom{N_w}{2}} \sum_{i=1}^{N_s} \sum_{j=1}^{N_w} \sum_{k=j+1}^{N_w} |m_{i,j} - m_{i,k}|$$

Music Lab Experiment

PoCS | @pocsvox

Voting, Success,
and Superstars

Sensible result:

- Stronger social signal leads to **greater following** and **greater inequality**.

Winning: it's not
for everyone

Superstars

Musiclab

References

Peculiar result:

- Stronger social signal leads to greater unpredictability.

Very peculiar observation:

- The most unequal distributions would suggest the greatest variation in underlying quality.
- But success may be due to social construction through following.
