Scalingarama

General observation:

Systems (complex or not) that cross many spatial and temporal scales often exhibit some form of scaling.

Outline—All about scaling:

- Basic definitions.
- Examples.

In CocoNuTs:

- Advances in measuring your power-law relationships.
- Scaling in blood and river networks.
- The Unsolved Allometry Theoricides.

Definitions

A power law relates two variables x and y as follows:

$$y = cx^{\alpha}$$

- & α is the scaling exponent (or just exponent)
- $\stackrel{\bullet}{\Leftrightarrow} \alpha$ can be any number in principle but we will find various restrictions.
- c is the prefactor (which can be important!)

Definitions

- \clubsuit The prefactor c must balance dimensions.
- & Imagine the height ℓ and volume v of a family of shapes are related as:

$$\ell = c v^{1/4}$$

Using [·] to indicate dimension, then

$$[c] = [l]/[V^{1/4}] = L/L^{3/4} = L^{1/4}.$$

theorem.

Scaling-at-large

Looking at data

Power-law relationships are linear in log-log space:

$$y = cx^{\alpha}$$

$$\Rightarrow \log_b y = \alpha \log_b x + \log_b c$$

with slope equal to α , the scaling exponent.

- Much searching for straight lines on log-log or double-logarithmic plots.
- Good practice: Always, always, always use base 10.
- Talk only about orders of magnitude (powers of 10).

Language

Specialization References

少 Q ← 9 of 99

Why is $\alpha \simeq 1.23$?

Quantities (following Zhang and Sejnowski):

- $\mathcal{L} G = \text{Volume of gray matter (cortex/processors)}$
- $\gg W = \text{Volume of white matter (wiring)}$
- Rack T = Cortical thickness (wiring)
- &L = Average length of white matter fibers
- $\gg p$ = density of axons on white matter/cortex interface

A rough understanding:

- $G \sim ST$ (convolutions are okay)
- $\Re W \sim \frac{1}{2}pSL$
- $\mathfrak{F} \subset L^3 \leftarrow \mathsf{this} \; \mathsf{is} \; \mathsf{a} \; \mathsf{little} \; \mathsf{sketchy...}$
- \Leftrightarrow Eliminate S and L to find $W \propto G^{4/3}/T$

PoCS | @pocsvox Scaling

Tricksiness:

- \Longrightarrow With V = G + W, some power laws must be approximations.
- Measuring exponents is a hairy business...

Definitions

Power laws are the signature of scale invariance:

Scale invariant 'objects' look the 'same' when they are appropriately rescaled.

- & 'Same' might be 'statistically the same'
- To rescale means to change the units of measurement for the relevant variables

PoCS | @pocsvox Scaling

Language Technology Specialization

References

•9 q (~ 17 of 99

PoCS | @pocsvox

Good scaling:

General rules of thumb:

- & High quality: scaling persists over three or more orders of magnitude for each variable.
- Medium quality: scaling persists over three or more orders of magnitude for only one variable and at least one for the other.
- Very dubious: scaling 'persists' over less than an order of magnitude for both variables.

The many scales of life:

The biggest living things (left). All the organisms are drawn to the same scale. 1, The largest flying bird (albatross); 2, the largest florown animal (the blue whale.) 3, the largest extinct land mammal (Baluchitherum) that the largest living land animal (giarfe); 5, 70; rannosarus; 6, Diplodocus; 7, one of the largest thing land animal (giarfe); 5, 70; rannosarus; 6, Diplodocus; 7, one of the largest perble (Plerandom); 8, the largest extinct snake; 9, the length of the largest perworm found in man; 10, the largest living reptile (West African crocodile); 71, the largest living lizard (Komodo dragon); 15, sheep; 16, the largest bird bird (Komodo dragon); 15, sheep; 16, the largest bird (she largest laving lizard (Komodo dragon); 15, sheep; 16, the largest living lizard (showled bird); 17, large tarpon; 22, the largest loster; 23, the largest and largest mollus (Geep-water 105 feet of the largest organism (giant sequoia), with a 100-foot larch superposed.

p. 2, McMahon and Bonner^[24]

Definitions

Isometry versus Allometry:

& Iso-metry = 'same measure'

Allo-metry = 'other measure'

We use allometric scaling to refer to both:

1. Nonlinear scaling of a dependent variable on an independent one (e.g., $y \propto x^{1/3}$)

2. The relative scaling of correlated measures (e.g., white and gray matter).

9 Q € 54 of 99

²Length is a dimension, furlongs and smoots ☑ are units

Example:

Simple pendulum:

Idealized mass/platypus swinging forever.

Four quantities:

- 1. Length ℓ ,
- 2. mass m,
- gravitational acceleration g, and
- 4. pendulum's period τ .

 \clubsuit Turn over your envelopes and find some π 's.

少 q (~ 55 of 99

A little formalism:

- Game: find all possible independent combinations of the $\{q_1,q_2,\dots,q_n\}$, that form dimensionless quantities $\{\pi_1,\pi_2,\dots,\pi_p\}$, where we need to figure out p (which must be $\leq n$).
- \mathfrak{S} Consider $\pi_i = q_1^{x_1} q_2^{x_2} \cdots q_n^{x_n}$.
- \aleph We (desperately) want to find all sets of powers x_i that create dimensionless quantities.
- $\ \, \& \ \, \text{Dimensions: want} \, [\pi_i] = [q_1]^{x_1} [q_2]^{x_2} \cdots [q_n]^{x_n} = 1.$
- For the platypus pendulum we have $[q_1] = L$, $[q_2] = M$, $[q_3] = LT^{-2}$, and $[q_4] = T$, with dimensions $d_1 = L$, $d_2 = M$, and $d_3 = T$.
- \Re So: $[\pi_i] = L^{x_1} M^{x_2} (LT^{-2})^{x_3} T^{x_4}$.
- & We regroup: $[\pi_i] = L^{x_1+x_3}M^{x_2}T^{-2x_3+x_4}$.
- & We now need: $x_1 + x_3 = 0$, $x_2 = 0$, and $-2x_3 + x_4$.
- Time for matrixology ...

Well, of course there are matrices:

Thrillingly, we have:

$$\mathbf{A}\vec{x} = \left[\begin{array}{ccc} 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -2 & 1 \end{array} \right] \left[\begin{array}{c} x_1 \\ x_2 \\ x_3 \\ x_4 \end{array} \right] = \left[\begin{array}{c} 0 \\ 0 \\ 0 \end{array} \right]$$

- \clubsuit A nullspace equation: $\mathbf{A}\vec{x} = \vec{0}$.
- Number of dimensionless parameters = Dimension of null space = n - r where n is the number of columns of \mathbf{A} and r is the rank of \mathbf{A} .
- \Re Here: n=4 and $r=3 \to F(\pi_1)=0 \to \pi_1$ = const.
- \mathbb{A} In general: Create a matrix **A** where ijth entry is the power of dimension i in the ith variable, and solve by row reduction to find basis null vectors.
- \Re We (you) find: $\pi_1 = \ell/g\tau^2 = \text{const.}$ Upshot: $\tau \propto \sqrt{\ell}$. Insert question from assignment 1 🗹

"Scaling, self-similarity, and intermediate asymptotics" 3, 4

by G. I. Barenblatt (1996). [2]

G. I. Taylor, magazines, and classified secrets:

1945 New Mexico Trinity test:

Self-similar blast wave:

 \Re Radius: [R] = L, Time: [t] = T, Density of air: $[\rho] = M/L^3$, Energy: $[E] = \dot{M}L^2/T^2$.

- Four variables, three dimensions.
- One dimensionless variable: $E = \text{constant} \times \rho R^5/t^2$.
- & Scaling: Speed decays as $1/R^{3/2}$.

Related: Radiolab's Elements 🗗 on the Cold War, the Bomb Pulse, and the dating of cell age (33:30).

Advances in turbulence:

In 1941, Kolmogorov, armed only with dimensional analysis and an envelope figures this out: [?]

$$E(k) = C\epsilon^{2/3}k^{-5/3}$$

- & E(k) = energy spectrum function.
- & ϵ = rate of energy dissipation.
- Energy is distributed across all modes, decaying with wave number.
- No internal characteristic scale to turbulence.
- Stands up well experimentally and there has been no other advance of similar magnitude.

Scaling in Cities:

"Growth, innovation, scaling, and the pace of life in cities"

Bettencourt et al., Proc. Natl. Acad. Sci., 104, 7301-7306, 2007. [4]

Quantified levels of

- Infrastructure
- Wealth
- Crime levels

β=1.12 R²=0.97

- Disease
- Energy consumption

as a function of city size N (population).

^dNote to self: Make millions with the "Fractal Diet"

Scaling in Cities:

Intriguing findings:

- & Global supply costs scale sublinearly with N $(\beta < 1)$.
 - Returns to scale for infrastructure.
- \clubsuit Total individual costs scale linearly with N ($\beta = 1$)
 - Individuals consume similar amounts independent of city size.
- \clubsuit Social quantities scale superlinearly with N ($\beta > 1$)
 - Creativity (# patents), wealth, disease, crime, ...

Density doesn't seem to matter...

Surprising given that across the world, we observe two orders of magnitude variation in area covered by agglomerations of fixed populations.

"Urban scaling and its deviations:

Revealing the structure of wealth,

PLoS ONE, **5**, e13541, 2010. [5]

Comparing city features across populations:

Cities = Metropolitan Statistical Areas (MSAs)

Story: Fit scaling law and examine residuals

Does a city have more or less crime than expected

Bettencourt et al.,

when normalized for population?

innovation and crime across cities"
