lacktrian section with the section of the section o natural one is to introduce correlations between different kinds of nodes.

distributions cover much territory but do not

low moving away from pure random networks was a

🗞 Node attributes may be anything, e.g.:

Random networks with arbitrary degree

1. degree

key first step.

- 2. demographics (age, gender, etc.)
- 3. group affiliation

represent all networks.

- 🗞 We speak of mixing patterns, correlations, biases...
- line with the still random at base but now have more global structure.
- 🗞 Build on work by Newman<sup>[5, 6]</sup>, and Boguñá and Serano.<sup>[1]</sup>.

### General mixing between node categories

- Assume types of nodes are countable, and are assigned numbers 1, 2, 3, ....
- Consider networks with directed edges.

 $e_{\mu\nu} = {\rm Pr} \left( \begin{array}{c} {\rm an \ edge \ connects \ a \ node \ of \ type \ } \\ {\rm to \ a \ node \ of \ type \ } \nu \end{array} \right.$ 

 $a_{\mu} = \mathbf{Pr}(an edge comes from a node of type <math>\mu)$ 

 $b_{\nu} = \mathbf{Pr}(an edge leads to a node of type <math>\nu)$ 

 $\mathfrak{K}$  Write  $\mathbf{E} = [e_{\mu\nu}], \vec{a} = [a_{\mu}], \text{ and } \vec{b} = [b_{\nu}].$ 🗞 Requirements:

$$\sum_{\mu \ \nu} e_{\mu \nu} = 1, \ \sum_{\nu} e_{\mu \nu} = a_{\mu}, \ \text{and} \sum_{\mu} e_{\mu \nu} = b_{\nu}.$$

References

### Notes:

- & Varying  $e_{\mu\nu}$  allows us to move between the following:
  - 1. Perfectly assortative networks where nodes only connect to like nodes, and the network breaks into subnetworks. Requires  $e_{\mu\nu} = 0$  if  $\mu \neq \nu$  and  $\sum_{\mu} e_{\mu\mu} = 1$ .
  - 2. Uncorrelated networks (as we have studied so far) For these we must have independence:
  - $e_{\mu\nu} = a_{\mu}b_{\nu}$ . 3. Disassortative networks where nodes connect to nodes distinct from themselves.
- Disassortative networks can be hard to build and may require constraints on the  $e_{\mu\nu}$ .
- 🗞 Basic story: level of assortativity reflects the degree to which nodes are connected to nodes within their group.

## Correlation coefficient:

Quantify the level of assortativity with the following assortativity coefficient<sup>[6]</sup>:

$$r = \frac{\sum_{\mu} e_{\mu\mu} - \sum_{\mu} a_{\mu} b_{\mu}}{1 - \sum_{\mu} a_{\mu} b_{\mu}} = \frac{\mathrm{Tr} \, \mathbf{E} - ||E^2||_1}{1 - ||E^2||_1}$$

where  $|| \cdot ||_1$  is the 1-norm = sum of a matrix's entries

- Tr E is the fraction of edges that are within groups.
- $||E^2||_1$  is the fraction of edges that would be within groups if connections were random.
- $largenumber ||E^2||_1$  is a normalization factor so  $r_{max} = 1$ .
- $\circledast$  When Tr  $e_{\mu\mu} = 1$ , we have r = 1.
- $\bigotimes$  When  $e_{\mu\mu} = a_{\mu}b_{\mu}$ , we have r = 0.

かへで 8 of 40

## Correlation coefficient:

#### Notes:

- r = -1 is inaccessible if three or more types are present.
- lisassortative networks simply have nodes connected to unlike nodes-no measure of how unlike nodes are.
- Minimum value of r occurs when all links between non-like nodes: Tr  $e_{\mu\mu} = 0$ .

$$r_{\min} = \frac{-||E^2||_1}{1-||E^2||_1}$$

where  $-1 \le r_{\min} < 0$ .

PoCS

## Scalar quantities

r =

- 🗞 Now consider nodes defined by a scalar integer quantity.
- 🚳 Examples: age in years, height in inches, number of friends, ...
- $\bigotimes e_{ik}$  = **Pr** (a randomly chosen edge connects a node with value *j* to a node with value *k*).
- $\bigotimes_{i} a_{i}$  and  $b_{k}$  are defined as before.
- 🗞 Can now measure correlations between nodes based on this scalar quantity using standard Pearson correlation coefficient

$$\frac{\sum_{j\,k} j\,k(e_{jk} - a_j b_k)}{\sigma_a \,\sigma_b} = \frac{\langle jk \rangle - \langle j \rangle_a \langle k \rangle_b}{\sqrt{\langle j^2 \rangle_a - \langle j \rangle_a^2} \sqrt{\langle k^2 \rangle_b - \langle k \rangle_b^2}} \underset{\text{New Normalization}}{\overset{\text{PoCS}}{\longrightarrow}}$$

This is the observed normalized deviation from randomness in the product *jk*.

#### Degree-degree correlations

- Autural correlation is between the degrees of connected nodes.
- $\bigotimes$  Now define  $e_{ik}$  with a slight twist:

 $e_{jk} = \Pr\left(\begin{array}{c} \text{an edge connects a degree } j+1 \text{ node} \\ \text{to a degree } k+1 \text{ node} \end{array}\right)$ 

 $= \mathbf{Pr} \left( \begin{array}{c} \text{an edge runs between a node of in-degree } j \\ \text{and a node of out-degree } k \end{array} \right)$ 

- $\mathbb{R}$  Useful for calculations (as per  $R_k$ )
- $\bigotimes$  Important: Must separately define  $P_0$  as the  $\{e_{jk}\}$ contain no information about isolated nodes.
- Directed networks still fine but we will assume from here on that  $e_{jk} = e_{kj}$ .

### Degree-degree correlations

Definition

General mixing Assortativity by degree

where, as before,  $R_k$  is the probability that a randomly chosen edge leads to a node of degree k+1, and

 $r = \frac{\sum_{j\,k} j\,k(e_{jk}-R_jR_k)}{\sigma_R^2}$ 

A Notation reconciliation for undirected networks:

$$\sigma_R^2 = \sum_j j^2 R_j - \left[\sum_j j R_j\right]^2.$$

### **Degree-degree correlations**

#### Error estimate for *r*:

- Remove edge *i* and recompute *r* to obtain  $r_i$ .
- Repeat for all edges and compute using the jackknife method 🗹 [3]

$$\sigma_r^2 = \sum_i (r_i - r)^2.$$

Mildly sneaky as variables need to be independent. for us to be truly happy and edges are correlated...

- line social networks tend to be assortative (homophily)
- 🗞 Technological and biological networks tend to be disassortative

## Spreading on degree-correlated networks

- 🚳 Next: Generalize our work for random networks to degree-correlated networks.
- $\clubsuit$  As before, by allowing that a node of degree k is activated by one neighbor with probability  $B_{k1}$ , we can handle various problems:
  - 1. find the giant component size.
  - 2. find the probability and extent of spread for simple disease models.
  - 3. find the probability of spreading for simple threshold models.

### Spreading on degree-correlated networks

- Sol: Find  $f_{n,j}$  = **Pr** an edge emanating from a degree j + 1 node leads to a finite active subcomponent of size *n*.
- $\Re$  Repeat: a node of degree k is in the game with probability  $B_{k1}$ .
- $\bigotimes$  Define  $\vec{B}_1 = [B_{k1}]$ .
- lan: Find the generating function  $F_j(x; \vec{B}_1) = \sum_{n=0}^{\infty} f_{n,j} x^n.$

Assortativity by degree

### Spreading on degree-correlated networks

🗞 Recursive relationship:

$$\begin{split} F_j(x;\vec{B}_1) &= x^0 \sum_{k=0}^{\infty} \frac{e_{jk}}{R_j} (1-B_{k+1,1}) \\ &+ x \sum_{k=0}^{\infty} \frac{e_{jk}}{R_j} B_{k+1,1} \left[ F_k(x;\vec{B}_1) \right]^k \end{split}$$

- line first term = **Pr** (that the first node we reach is not in the game).
- line second term involves **Pr** (we hit an active node which has k outgoing edges).
- line average size of active components reached by following a link from a degree j + 1node =  $F'_{i}(1; \vec{B}_{1})$ .

PoCS

Spreading on degree-correlated networks

- $\mathfrak{F}_{i}(x; \mathbf{B}_{1})$ , set x = 1, and rearrange.
- $\mathfrak{R}$  We use  $F_k(1; \mathbf{B}_1) = 1$  which is true when no giant component exists. We find:

$$R_j F_j'(1;\vec{B}_1) = \sum_{k=0}^{\infty} e_{jk} B_{k+1,1} + \sum_{k=0}^{\infty} k e_{jk} B_{k+1,1} F_k'(1;\vec{B}_1).^{\text{References}}$$

 $\mathfrak{K}$  Rearranging and introducing a sneaky  $\delta_{ik}$ :

$$\sum_{k=0}^{\infty} \left( \delta_{jk} R_k - k B_{k+1,1} e_{jk} \right) F'_k(1; \vec{B}_1) = \sum_{k=0}^{\infty} e_{jk} B_{k+1,1}.$$

## Spreading on degree-correlated networks

🗞 So, in principle at least:

$$\vec{F}'(1;\vec{B}_1) = \mathbf{A}_{\mathbf{E},\vec{B}_1}^{-1} \, \mathbf{E} \vec{B}_1$$

- $\mathfrak{K}$  Now: as  $\vec{F}'(1; \vec{B}_1)$ , the average size of an active component reached along an edge, increases, we move towards a transition to a giant component.
- Right at the transition, the average component size explodes.
- Exploding inverses of matrices occur when their determinants are 0.
- The condition is therefore:

$$\det \mathbf{A}_{\mathbf{E},\vec{B}_1} = 0$$

### Spreading on degree-correlated networks

🚳 General condition details:

$$\det \mathbf{A}_{\mathbf{E},\vec{B}_1} = \det \left[ \delta_{jk} R_{k-1} - (k-1) B_{k,1} e_{j-1,k-1} \right] = 0. \quad \mbox{General mixing}_{Assortativity by} = 0. \quad \mbox{General mixing}_{Assortativity} = 0. \quad \mbox{G$$

- The above collapses to our standard contagion condition when  $e_{jk} = R_j R_k$  (see next slide). <sup>[2]</sup>
- $\Re$  When  $\vec{B}_1 = B\vec{1}$ , we have the condition for a simple disease model's successful spread

$$\det \left[ \delta_{jk} R_{k-1} - B(k-1) e_{j-1,k-1} \right] = 0.$$

 $\mathfrak{R}$  When  $\vec{B}_1 = \vec{1}$ , we have the condition for the existence of a giant component:

$$\det \left[ \delta_{jk} R_{k-1} - (k-1) e_{j-1,k-1} \right] = 0$$

Bonusville: We'll find a much better version of this set of conditions later...

## Spreading on degree-correlated networks

#### We'll next find two more pieces:

- 1.  $P_{\text{trig}}$ , the probability of starting a cascade
- 2. S, the expected extent of activation given a small seed.

#### Triggering probability:

Generating function:

$$H(x;\vec{B}_1) = x \sum_{k=0}^{\infty} P_k \left[ F_{k-1}(x;\vec{B}_1) \right]^k.$$

🗞 Generating function for vulnerable component size is more complicated.

UNIVERSITY 

PoCS

COcoNuTS

Definition

degree

Contagion

References

General mixing

Assortativity by

Triggering probability

### Spreading on degree-correlated networks

🗞 Want probability of not reaching a finite component.

$$\begin{split} P_{\mathrm{trig}} &= S_{\mathrm{trig}} = 1 - H(1; \vec{B}_1) \\ &= 1 - \sum_{k=0}^\infty P_k \left[ F_{k-1}(1; \vec{B}_1) \right]^k. \end{split}$$

- $\bigotimes$  Last piece: we have to compute  $F_{k-1}(1; \vec{B}_1)$ .
- A Nastier (nonlinear)—we have to solve the recursive expression we started with when x = 1:  $F_j(1; \vec{B}_1) = \sum_{k=0}^{\infty} \frac{e_{jk}}{R_j} (1 - B_{k+1,1}) +$

$$\frac{E_{jk}}{R_j}B_{k+1,1}\left[F_k(1;\vec{B}_1)\right]^k$$
.

Iterative methods should work here.

#### Spreading on degree-correlated networks

- Truly final piece: Find final size using approach of Gleeson<sup>[4]</sup>, a generalization of that used for uncorrelated random networks.
- $\bigotimes$  Need to compute  $\theta_{j,t}$ , the probability that an edge leading to a degree j node is infected at time t.
- Evolution of edge activity probability:

$$\theta_{j,t+1}=G_j(\vec{\theta}_t)=\phi_0+(1-\phi_0)\times$$

$$\sum_{k=1}^{\infty} \frac{e_{j-1,k-1}}{R_{j-1}} \sum_{i=0}^{k-1} \binom{k-1}{i} \theta_{k,t}^i (1-\theta_{k,t})^{k-1-i} B_{ki}.$$

Overall active fraction's evolution:

$$\phi_{t+1} = \phi_0 + (1-\phi_0) \sum_{k=0}^{\infty} P_k \sum_{i=0}^k \binom{k}{i} \theta_{k,t}^i (1-\theta_{k,t})^{k-i} B_{ki}.$$

 $\sum_{k=0}^{\infty} \frac{e}{R}$ 

### Spreading on degree-correlated networks

- 🗞 As before, these equations give the actual evolution of  $\phi_t$  for synchronous updates.
- $\bigotimes$  Contagion condition follows from  $\vec{\theta}_{t+1} = \vec{G}(\vec{\theta}_t)$ .
- $\bigotimes$  Expand  $\vec{G}$  around  $\vec{\theta}_0 = \vec{0}$ .

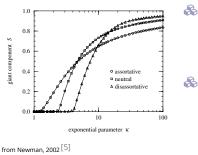

$$\theta_{j,t+1} = G_j(\vec{0}) + \sum_{k=1}^{\infty} \frac{\partial G_j(\vec{0})}{\partial \theta_{k,t}} \theta_{k,t} + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots \xrightarrow[\operatorname{Spreading constraints}]{\operatorname{Spreading constraints}} + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots \xrightarrow[\operatorname{Spreading constraints}]{\operatorname{Spreading constraints}} + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots \xrightarrow[\operatorname{Spreading constraints}]{\operatorname{Spreading constraints}} + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots \xrightarrow[\operatorname{Spreading constraints}]{\operatorname{Spreading constraints}} + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} \theta_{k,t}^2 + \cdots + \frac{1}{2!} \sum_{k=1}^{\infty} \frac{\partial^2 G_j(\vec{0})}{\partial \theta_{k,t}^2} + \cdots + \frac{1}{2!$$

- $ightarrow G_i(\vec{0}) \neq 0$  for at least one *j*, always have some infection.
- $\mathfrak{K}$  If  $G_i(\vec{0}) = 0 \forall j$ , want largest eigenvalue  $\left[\frac{\partial G_j(\vec{0})}{\partial \theta_{k,t}}\right] > 1.$
- Condition for spreading is therefore dependent on eigenvalues of this matrix:

$$\frac{\partial G_j(\vec{0})}{\partial \theta_{k,t}} = \frac{e_{j-1,k-1}}{R_{j-1}}(k-1)B_{k1}$$

Insert question from assignment 9 🖸

## How the giant component changes with assortativity:

🗞 More assortative networks percolate for lower average degrees 🚳 But disassortative networks end up with higher extents of

spreading.
