Introduction

Branching networks are useful things:

• Fundamental to material **supply and collection**

• **Supply:** From one source to many sinks in 2- or 3-d.

• **Collection:** From many sources to one sink in 2- or 3-d.

• Typically observe hierarchical, recursive self-similar structure

Examples:

• River networks (our focus)

• Cardiovascular networks

• Plants

• Evolutionary trees

• Organizations (only in theory ...)

Geomorphological networks

Definitions

- ☘ **Drainage basin** for a point p is the complete region of land from which overland flow drains through p .
- ☘ Definition most sensible for a point in a stream.
- ☘ **Recursive structure**: Basins contain basins and so on.
- ☘ In principle, a drainage basin is defined at every point on a landscape.
- ☘ On flat hillslopes, drainage basins are effectively linear.
- ☘ We treat subsurface and surface flow as following the gradient of the surface.
- ☘ Okay for large-scale networks ...

FIG. 4.—An ideal chronological summary of the development of a drainage system given for purposes of comparison only. The first four parts show extension, that is, initiation, 2, elongation; 3, elaboration; and 4, maximum extension. Parts 5 and 6 represent steps during integration.

The sequential stages recognized in the evolution of a drainage system are "extension" and "integration"; the first, a stage of increasing complexity; the second, of simplification.

Basic basin quantities: a , l , L_{\parallel} , L_{\perp} :

- ☘ a = drainage basin area
- ☘ l = length of longest (main) stream (which may be fractal)
- ☘ $L = L_{\parallel}$ = longitudinal length of basin
- ☘ $L = L_{\perp}$ = width of basin

There are a few more 'laws': [1]

| Relation: | Name or description: |
|---|--|
| $T_k = T_1 (R_T)^{k-1}$ | Tokunaga's law |
| $\ell \sim L^d$ | self-affinity of single channels |
| $n_\omega / n_{\omega+1} = R_n$ | Horton's law of stream numbers |
| $\ell_{\omega+1} / \ell_\omega = R_\ell$ | Horton's law of main stream lengths |
| $\bar{a}_{\omega+1} / \bar{a}_\omega = R_a$ | Horton's law of basin areas |
| $\bar{s}_{\omega+1} / \bar{s}_\omega = R_s$ | Horton's law of stream segment lengths |
| $L_\perp \sim L^H$ | scaling of basin widths |
| $P(a) \sim a^{-\tau}$ | probability of basin areas |
| $P(\ell) \sim \ell^{-\gamma}$ | probability of stream lengths |
| $\ell \sim a^h$ | Hack's law |
| $a \sim L^D$ | scaling of basin areas |
| $\Lambda \sim a^\beta$ | Langbein's law |
| $\lambda \sim L^\varphi$ | variation of Langbein's law |

Basin allometry

Allometric relationships:

$\ell \propto a^h$

$\ell \propto L^d$

Combine above:

$a \propto L^{d/h} \equiv L^D$

Reported parameter values: [1]

| Parameter: | Real networks: |
|----------------|----------------|
| R_n | 3.0-5.0 |
| R_a | 3.0-6.0 |
| $R_\ell = R_T$ | 1.5-3.0 |
| T_1 | 1.0-1.5 |
| d | 1.1 ± 0.01 |
| D | 1.8 ± 0.1 |
| h | 0.50-0.70 |
| τ | 1.43 ± 0.05 |
| γ | 1.8 ± 0.1 |
| H | 0.75-0.80 |
| β | 0.50-0.70 |
| φ | 1.05 ± 0.05 |

'Laws'

Hack's law (1957) [3]:

$\ell \propto a^h$

reportedly $0.5 < h < 0.7$

Scaling of main stream length with basin size:

$\ell \propto L^d$

reportedly $1.0 < d < 1.1$

Basin allometry:

$L_\perp \propto a^{h/d} \equiv a^{1/D}$

$D < 2 \rightarrow$ basins elongate.

Kind of a mess ...

Order of business:

1. Find out how these relationships are connected.
2. Determine most fundamental description.
3. Explain origins of these parameter values

For (3): **Many attempts: not yet sorted out ...**

Stream Ordering:

Method for describing network architecture:

- Introduced by Horton (1945)^[4]
- Modified by Strahler (1957)^[7]
- Term: Horton-Strahler Stream Ordering^[5]
- Can be seen as **iterative trimming** of a network.

Stream Ordering—A large example:

CocoNuTS

Introduction

 Allometry
 Laws
Stream Ordering
 Horton's Laws
 Tokunaga's Law
 Nutshell
 References

Stream Ordering:

Some definitions:

- A **channel head** is a point in landscape where flow becomes focused enough to form a stream.
- A **source stream** is defined as the stream that reaches from a channel head to a junction with another stream.
- Roughly analogous to capillary vessels.
- Use symbol $\omega = 1, 2, 3, \dots$ for stream order.

CocoNuTS

Introduction
 Definitions
 Allometry
 Laws
Stream Ordering
 Horton's Laws
 Tokunaga's Law
 Nutshell
 References

Stream Ordering:

Another way to define ordering:

- As before, label all **source streams** as **order $\omega = 1$** .
- Follow all labelled streams **downstream**
- Whenever two streams of the same order (ω) meet, the resulting stream has order incremented by 1 ($\omega + 1$).

- If streams of different orders ω_1 and ω_2 meet, then the resultant stream has order equal to the largest of the two.

Simple rule:

$$\omega_3 = \max(\omega_1, \omega_2) + \delta_{\omega_1, \omega_2}$$

where δ is the Kronecker delta.

CocoNuTS

Introduction
 Definitions
 Allometry
 Laws
Stream Ordering
 Horton's Laws
 Tokunaga's Law

Stream Ordering:

- Label all **source streams** as **order $\omega = 1$** and remove.
- Label all **new** source streams as **order $\omega = 2$** and remove.
- Repeat until one stream is left (order = Ω)
- Basin is said to be of the order of the last stream removed.
- Example above is a basin of order $\Omega = 3$.

Stream Ordering:

One problem:

- Resolution of data messes with ordering
- Micro-description changes (e.g., order of a basin may increase)
- ...but relationships based on ordering appear to be robust to resolution changes.

Utility:

- Stream ordering helpfully discretizes a network.
- Goal: understand **network architecture**

Stream Ordering:

Resultant definitions:

- ☛ A basin of order Ω has n_ω streams (or sub-basins) of order ω .
 $n_\omega > n_{\omega+1}$
- ☛ An order ω basin has **area** a_ω .
- ☛ An order ω basin has a **main stream length** ℓ_ω .
- ☛ An order ω basin has a **stream segment length** s_ω
 1. an order ω stream segment is only that part of the stream which is actually of order ω
 2. an order ω stream segment runs from the basin outlet up to the junction of two order $\omega - 1$ streams

Horton's laws

Self-similarity of river networks

- ☛ First quantified by Horton (1945)^[4], expanded by Schumm (1956)^[6]

Three laws:

- ☛ Horton's law of stream numbers:

$$n_\omega / n_{\omega+1} = R_n > 1$$

- ☛ Horton's law of stream lengths:

$$\bar{\ell}_{\omega+1} / \bar{\ell}_\omega = R_\ell > 1$$

- ☛ Horton's law of basin areas:

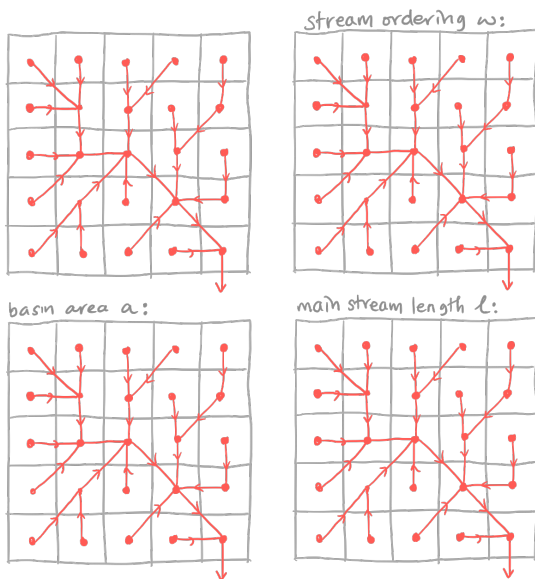

$$\bar{a}_{\omega+1} / \bar{a}_\omega = R_a > 1$$

Horton's laws

Horton's Ratios:

- ☛ So ...laws are defined by three ratios:

$$R_n, R_\ell, \text{ and } R_a.$$

- ☛ Horton's laws describe **exponential decay or growth**:

$$\begin{aligned} n_\omega &= n_{\omega-1} / R_n \\ &= n_{\omega-2} / R_n^2 \\ &\vdots \\ &= n_1 / R_n^{\omega-1} \\ &= n_1 e^{-(\omega-1) \ln R_n} \end{aligned}$$

Horton's laws

Similar story for area and length:

$$\bar{a}_\omega = \bar{a}_1 e^{(\omega-1)\ln R_a}$$

$$\bar{\ell}_\omega = \bar{\ell}_1 e^{(\omega-1)\ln R_\ell}$$

As stream order increases, **number drops** and **area and length increase**.

Horton's laws

Observations:

Horton's ratios vary:

| | |
|----------|---------|
| R_n | 3.0–5.0 |
| R_a | 3.0–6.0 |
| R_ℓ | 1.5–3.0 |

- No accepted explanation for these values.
- Horton's laws tell us how quantities vary from level to level ...
- ...but they don't explain how networks are structured.

Network Architecture

Tokunaga's law

Property 1: Scale independence—depends only on difference between orders:

$$T_{\mu,\nu} = T_{\mu-\nu}$$

Property 2: Number of side streams grows exponentially with difference in orders:

$$T_{\mu,\nu} = T_1(R_T)^{\mu-\nu-1}$$

We usually write Tokunaga's law as:

$$T_k = T_1(R_T)^{k-1} \text{ where } R_T \approx 2$$

Tokunaga's law

Delving deeper into network architecture:

- Tokunaga (1968) identified a clearer picture of network structure [8, 9, 10]
- As per Horton-Strahler, use **stream ordering**.
- Focus:** describe how streams of different orders connect to each other.
- Tokunaga's law is also a law of averages.

Network Architecture

Definition:

- $T_{\mu,\nu}$ = the average number of **side streams of order ν** that enter as tributaries to streams of **order μ**
- $\mu, \nu = 1, 2, 3, \dots$
- $\mu \geq \nu + 1$
- Recall each stream segment of order μ is 'generated' by two streams of order $\mu - 1$
- These generating streams are not considered side streams.

Nutshell:

- ☞ Branching networks show remarkable **self-similarity** over many scales.
- ☞ There are many interrelated scaling laws.
- ☞ Horton-Strahler **Stream ordering** gives one useful way of getting at the architecture of branching networks.
- ☞ **Horton's laws** reveal self-similarity.
- ☞ Horton's laws can be misinterpreted as suggesting a pure hierarchy.
- ☞ **Tokunaga's laws** neatly describe network architecture.
- ☞ Branching networks exhibit a mixed hierarchical structure.
- ☞ Horton and Tokunaga can be connected analytically.
- ☞ Surprisingly:

$$R_n = \frac{(2 + R_T + T_1) + \sqrt{(2 + R_T + T_1)^2 - 8R_T}}{2}$$
