Measuring temperature was thought impossible:

The properties measured by our instruments usually begin as subjective judgments. Temperature is a good example. People were aware of variations in temperature long before there were any objective measurements of temperature. Judgments of temperature are imperfectly correlated among different persons, or even the same person at different times, depending on the humidity, the person's activity level and age, surrounding air currents, and so on. The idea that anything as subtle and complex as all the manifestations of changes in temperature could be measured and quantified on a single numerical scale was scoffed at as impossible, even by the leading philosophers of the sixteenth century.

The first thermometer invented by Galileo in 1592 did not go far in dispelling the notion that temperature was inherently unmeasurable, because the earliest thermometers, for about their first hundred years, were so imperfect as to make it possible for those who wished to do so to argue that no one could ever succeed in measuring temperature. Temperature was then confounded with all the subtleties of subjective judgment, which easily seem incompatible with a single numerical scale of measurement. How could the height of a column of mercury in a glass tube possibly reflect the rich varieties of temperature—damp cold, dank cold, frosty cold, crisp cold, humid heat, searing heat, scalding heat, dry heat, feverish heat, prickly heat, and so on?

From "Bias in Mental Testing", Arthur Jensen, 1980^[18]
per [@SilverVVulpes](#) : Also: Inventing Temperature, Hasok Chang, 2004^[4]

Measuring temperature was thought impossible:

The early thermometers were inconsistent, both with themselves and with each other. Because they consisted of open-ended glass tubes, they were sensitive to changes in barometric pressure as well as to temperature. And there were problems of calibration, such as where to locate the zero point and how to divide the column of mercury into units. It was believed, incorrectly, that all caves had the same temperature, so thermometers were calibrated in caves. The freezing and boiling points of water were also used in calibration, but, as these vary with impurities in the water and the barometric pressure, the calibration of different thermometers at different times and places resulted in thermometers that failed to correlate perfectly with one another in any given instance. They lacked reliability, as we now would say.

All the while, no one knew what temperature is in a theoretical or scientific sense. There was no theory of thermodynamics that could explain temperature phenomena and provide a complete scientific rationale for the construction and calibration of thermometers. Yet quite adequate and accurate thermometers, hardly differing from those we use today, were eventually developed by the middle of the eighteenth century. Thus the objective measurement of temperature considerably preceded the development of an adequate theory of temperature and heat, and necessarily so, as the science of thermodynamics could not possibly have developed without first having been able to quantify or measure the temperatures of liquids, gasses, and other substances independently of

Desiring happiness—not just for boffins:

 Average people routinely report being happy is what they want most in life ^[25, 26, 9]

 And it matters: “Happy people live longer:...”
Survey by Diener and Chan. ^[9]

A Plateau of Happiness

A country's wealth may not always dictate the happiness of its people.

As part of the World Values Survey project, inhabitants of different countries and territories were asked how happy or satisfied they were. Below is a sampling of happiness rankings, along with economic status.

*Poll results for these countries were from 1995.

Meaning rather than happiness:

"Mindfulness in Plain English" [a](#) [↗](#)
by Henepola Gunaratana (1992). [16]

"Flow" [a](#) [↗](#)
by Mihaly Csikszentmihalyi (1990). [7]

Can we measure Flow in a big data way?

Maybe drops in social media usage indicate people are doing okay?

Fig. 1. Mean happiness reported during each activity (**top**) and while mind wandering to unpleasant topics, neutral topics, pleasant topics or not mind wandering (**bottom**). Dashed line indicates mean of happiness across all samples. Bubble area indicates the frequency of occurrence. The largest bubble ("not mind wandering") corresponds to 53.1% of the samples, and the smallest bubble ("praying/worshipping/meditating") corresponds to 0.1% of the samples.

We'd like to build an 'hedonometer':

An instrument to 'remotely-sense' emotional states and levels, in real time or post hoc.

Ideally:

Transparent

Fast

Based on written expression

Uses human evaluation

Non-reactive

Complementary to self-reported measures

Improvable

Measuring the perceived happiness of a text:

Lyrics for
Michael Jackson's Billie Jean

"She was more like a beauty queen
from a movie scene.

⋮

And mother always told me,
be careful who you love.
And be careful of what you do
'cause the lie becomes the truth.

Billie Jean is not my lover,
She's just a girl who claims
that I am the one.

Happiness Word Shift Graph (early version):

Per word drop in valence of lyrics from 1980–2007 relative to valence of lyrics from 1960

Key:

Word data shift details:

Given two texts T_{ref} and T_{comp} :

Measure difference in average happiness:

$$h_{\text{avg}}^{(\text{comp})} - h_{\text{avg}}^{(\text{ref})}$$

Word data shift details:

Given two texts T_{ref} and T_{comp} :

Measure difference in average happiness:

$$h_{\text{avg}}^{(\text{comp})} - h_{\text{avg}}^{(\text{ref})}$$

Evident question: Which words contribute the most to this change?

Word data shift details:

Given two texts T_{ref} and T_{comp} :

 Measure difference in average happiness:

$$h_{\text{avg}}^{(\text{comp})} - h_{\text{avg}}^{(\text{ref})}$$

 Evident question: Which words contribute the most to this change?

 Break difference down by contributions from individual words:

$$\delta h_{\text{avg},i} = \frac{100}{|h_{\text{avg}}^{(\text{comp})} - h_{\text{avg}}^{(\text{ref})}|} \underbrace{[h_{\text{avg}}(w_i) - h_{\text{avg}}^{(\text{ref})}]}_{+/-} \underbrace{[p_i^{(\text{comp})} - p_i^{(\text{ref})}]}_{\uparrow/\downarrow}$$

Word data shift details:

Given two texts T_{ref} and T_{comp} :

 Measure difference in average happiness:

$$h_{\text{avg}}^{(\text{comp})} - h_{\text{avg}}^{(\text{ref})}$$

 Evident question: Which words contribute the most to this change?

 Break difference down by contributions from individual words:

$$\delta h_{\text{avg},i} = \frac{100}{|h_{\text{avg}}^{(\text{comp})} - h_{\text{avg}}^{(\text{ref})}|} \underbrace{[h_{\text{avg}}(w_i) - h_{\text{avg}}^{(\text{ref})}]}_{+/-} \underbrace{[p_i^{(\text{comp})} - p_i^{(\text{ref})}]}_{\uparrow/\downarrow}$$

 Must have: $\sum_i \delta h_{\text{avg},i} = \pm 100$

Word data shift details:

Given two texts T_{ref} and T_{comp} :

 Measure difference in average happiness:

$$h_{\text{avg}}^{(\text{comp})} - h_{\text{avg}}^{(\text{ref})}$$

 Evident question: Which words contribute the most to this change?

 Break difference down by contributions from individual words:

$$\delta h_{\text{avg},i} = \frac{100}{|h_{\text{avg}}^{(\text{comp})} - h_{\text{avg}}^{(\text{ref})}|} \underbrace{[h_{\text{avg}}(w_i) - h_{\text{avg}}^{(\text{ref})}]}_{+/-} \underbrace{[p_i^{(\text{comp})} - p_i^{(\text{ref})}]}_{\uparrow/\downarrow}$$

 Must have: $\sum_i \delta h_{\text{avg},i} = \pm 100$

 Rank words by $|\delta h_{\text{avg},i}|$

Word data shift details:

$$\begin{aligned}h_{\text{avg}}^{(\text{comp})} - h_{\text{avg}}^{(\text{ref})} &= \sum_{i=1}^N h_{\text{avg}}(w_i) p_i^{(\text{comp})} - \sum_{i=1}^N h_{\text{avg}}(w_i) p_i^{(\text{ref})} \\ &= \sum_{i=1}^N h_{\text{avg}}(w_i) [p_i^{(\text{comp})} - p_i^{(\text{ref})}] \\ &= \sum_{i=1}^N [h_{\text{avg}}(w_i) - h_{\text{avg}}^{(\text{ref})}] [p_i^{(\text{comp})} - p_i^{(\text{ref})}]\end{aligned}$$

where

$$\begin{aligned}\sum_{i=1}^N h_{\text{avg}}^{(\text{ref})} [p_i^{(\text{comp})} - p_i^{(\text{ref})}] &= h_{\text{avg}}^{(\text{ref})} \sum_{i=1}^N [p_i^{(\text{comp})} - p_i^{(\text{ref})}] \\ &= h_{\text{avg}}^{(\text{ref})} (1 - 1) = 0.\end{aligned}$$

So I really consider myself a storyteller. But I don't really tell stories in the usual way, in the sense that I don't usually tell my own stories. Instead, I'm really interested in building tools that allow large numbers of other people to tell their stories, people all around the world. I do this because I think that people actually have a lot in common. I think people are very similar, but I also think that we have trouble seeing that.

Feeling lonely Gender Both Age All Weather All Location All Date All

- i feel very lonely and unnoticed and that i am poised in a point of my life when i am able to do great things but just cant quite get them started**
March 30, 2006 / From a 31 year old in Fairfax Virginia United States when it was cloudy
- i feel lonely recently**
March 30, 2006 / from someone in Georgia United States
- i feel lonely things are all good but i miss the way things used to be**
March 31, 2006 / From an 18 year old female in Arizona United States
- i feel really lonely every night because i dont have any good friends irl that i can just talk about anything with**
March 31, 2006 / From a 17 year old male in Lawrenceville Georgia United States
- i feel really lonely and like any sensible loser i have to write about it in a blog**
March 31, 2006 / From an 18 year old male in Missouri United States
- i feel so lonely inside**
March 31, 2006 / From a 24 year old male in San Diego California United States when it was cloudy
- i feel soooooo lonely sometimes**
March 31, 2006 / From a 19 year old female in Ellensburg Washington United States
- i feel lonely**
March 31, 2006 / from someone
- i feel lonely i feel scared**
March 31, 2006 / From a 29 year old in Mount Vernon Ohio United States
- i feel lonely when im with her**
March 31, 2006 / from someone in Florida United States
- i feel so much less lonely knowing that there are people out there again**

PLOS ONE 10 Year Anniversary: Datasets

By sharing their underlying data and related metadata, authors increase the value and impact of their research. Since its inception, *PLOS ONE* has encouraged data sharing, and in 2014, in keeping with our commitment to openness, reproducibility and scientific progress, the journal began requiring authors to make their data publicly available

Per word average happiness shift $\delta h_{avg,r}$ (%)

Text element and context correlate in happiness scores:

- Compare ambient happiness with text element happiness.
- Spearman correlation coefficient:
 $r_s \simeq 0.79, p\text{-value} < 10^{-10}$.
- An on-average result: says nothing about any individual sentence.
- Extra random piece: **stemming is fallible**.

The screenshot shows a web browser window with the URL `hedonometer.org/wordshifterator/`. The page title is "The Wordshifterator." and the main heading is "The Wordshifterator." Below the heading, it says "Generate your own embeddable, shareable wordshifts for any pair of texts." and a note: "Note: Texts must contain at least 1,000 words. Details about how this works can be found [here](#)." The form contains several input fields: "Name of reference text:" with a text box containing "Reference Title"; "Name of comparison text:" with a text box containing "Comparison Title"; "Reference text:" with a large text area containing "Paste Reference Text Here"; "Comparison text:" with a large text area containing "Paste Comparison Text Here"; "Title:" with a text box; "Stopwords:" with a text box containing "Words to ignore, optional" and a sub-note: "A comma separated list of words that do not make sense in the context of these texts."; and "Language:" with a dropdown menu set to "English". A blue button labeled "Generate Wordshift" is at the bottom. The footer includes logos for The University of Vermont, MITRE, and VACC, along with copyright information: "Copyright © 2013 The MITRE Corporation & University of Vermont Computer Systems Center. All Rights Reserved. Privacy Policy" (approved for Public Release: 13-0865, Distribution Unlimited).

rednnneecckckkkkkkkk

2013/02/18 at 8:53 pm (Edit)

I've lived in quite a few places. The most recently Beaumont, TX. Its a pure hellhole. Hot, humid, trashy, terrible schools, corrupt government, lots of crime, no public parks or activities, terrible culture (other than crawfish boils), completely lacks diversity. This study confirms my suspicions that cities don't get any more miserable than this.

Eggheads find Beaumont IS the 'saddest city'

February 19, 2013 at 10:41 am by gator

Comments(3) | E-mail | Print | Tweet 0 | Recommend 0 | +1 0

That's what some eggheads at the Department of Mathematics and Statistics at the University of Vermont have determined.

The method to their madness? **Twitter**. They say they plotted 10 million geotagged Tweets in 2011.

"Happiness and the Patterns of Life: A Study of Geolocated Tweets"

Frank, Mitchell, Dodds, Danforth, and Danforth.

Nature Scientific Reports, **3**, 2625, 2013. ^[15]

Figure 6 | (A) Average happiness of words written as a function of distance from an author's expected location, with tweets grouped into ten equally populated bins. Expressed happiness grows logarithmically with distance distance from expected location. (B) A similar trend is observed when individuals are grouped into ten equally populated bins according to their gyradius. Both trends persist through variations in binning and different measures of mobility.

We grow fonder as we wander.
