Economics, Schmeconomics

Alan Greenspan (September 18, 2007):

"I've been dealing with these big mathematical models of forecasting the economy ...

If I could figure out a way to determine whether or not people are more fearful or changing to more euphoric,

I don't need any of this other stuff.

I could forecast the economy better than any way I know."

Economics, Schmeconomics

Greenspan continues:

"The trouble is that we can't figure that out. I've been in the forecasting business for 50 years. I'm no better than I ever was, and nobody else is. Forecasting 50 years ago was as good or as bad as it is today. And the reason is that human nature hasn't changed. We can't improve ourselves."

Jon Stewart:

"You just bummed the @*!# out of me."

Robert Kennedy on the Gross Domestic Product (GDP) in 1968:

"It measures everything except that which makes life worthwhile. And it can tell us everything about America except why we are proud that we are Americans." [21, 20]

Basic Science ≈ Describe + Explain:

Lord Kelvin (possibly):

- "To measure is to know."
- "If you cannot measure it, you cannot improve it."

But also:

- "There is nothing new to be discovered in physics now. All that remains is more and more precise measurement."
- "X-rays will prove to be a hoax."

Measuring temperature was thought impossible:

The properties measured by our instruments usually begin as subjective judgments. Temperature is a good example. People were aware of variations in temperature long before there were any objective measurements of temperature. Judgments of temperature are imperfectly correlated among different persons, or even the same person at different times, depending on the humidity, the person's activity level and age, surrounding air currents, and so on. The idea that anything as subtle and complex as all the manifestations of changes in temperature could be measured and quantified on a single numerical scale was scoffed at as impossible, even by the leading philosophers of the sixteenth century. The first thermometer invented by Galileo in 1592 did not go far in dispelling the notion that temperature was inherently unmeasurable, because the earliest thermometers, for about their first hundred years, were so imperfect as to make it possible for those who wished to do so to argue that no one could ever succeed in measuring temperature. Temperature was then confounded with all the subtleties of subjective judgment, which easily seem incompatible with a single numerical scale of measurement. How could the height of a column of mercury in a glass tube possibly reflect the rich varieties of temperature—damp cold, dank cold, frosty cold, crisp cold, humid heat, searing heat, scalding heat, dry heat, feverish heat, prickly heat, and so on?

From "Bias in Mental Testing", Arthur Jensen, 1980 [17] per @SilverVulpes: Also: Inventing Temperature, Hasok Chang, 2004 [3]

Measuring temperature was thought impossible:

The early thermometers were inconsistent, both with themselves and with each other. Because they consisted of open-ended glass tubes, they were sensitive to changes in barometric pressure as well as to temperature. And there were problems of calibration, such as where to locate the zero point and how to divide the column of mercury into units. It was believed, incorrectly, that all caves had the same temperature, so thermometers were calibrated in caves. The freezing and boiling points of water were also used in calibration, but, as these vary with impurities in the water and the barometric pressure, the calibration of different thermometers at different times and places resulted in thermometers that failed to correlate perfectly with one another in any given instance. They lacked reliability, as we now would say.

All the while, no one knew what temperature is in a theoretical or scientific sense. There was no theory of thermodynamics that could explain temperature phenomena and provide a complete scientific rationale for the construction and calibration of thermometers. Yet quite adequate and accurate thermometers, hardly differing from those we use today, were eventually developed by the middle of the eighteenth century. Thus the objective measurement of temperature considerably preceded the development of an adequate theory of temperature and heat, and necessarily so, as the science of thermodynamics could not possibly have developed without first having been able to quantify or measure the temperatures of liquids, gasses, and other substances independently of

From "Bias in Mental Testing", Arthur Jensen, 1980^[17]

What makes us happy?—Layard's summary:

Dominant factors:

- Family relationships
- Health
- Financial situation
- Personal Values
- Work
- Personal Freedom
- Community and Friends

Unimportant factors:

- Age
- Inherent intelligence
- Gender
- Looks
- Education

Desiring happiness—not just for boffins:

- Average people routinely report being happy is what they want most in life [24, 25, 8]
- And it matters: "Happy people live longer..." Survey by Diener and Chan. [8]

A Plateau of Happiness

A country's wealth may not always dictate the happiness of its people. As part of the World Values Survey project, inhabitants of different countries and territories were asked how happy or satisfied they were. Below is a sampling of happiness rankings, along with economic status.

*Poll results for these countries were from 1995.

Source: World Bank, "Worldwide Indicators and Values: A Clear-Cultural Sourcebook Based on the 1995-2000 World Survey"

National indices of well-being:

- Bhutan
- UK
- France
- Australia

30 Rock, S7E8:

JD: "Before she died, Colleen told me—she just wants me to be happy. 'I just want you to be happy.' You know who you say that to? A loser. Someone who can't hope for anything more in life than just being happy. You say that to someone who has disappointed you."

LL: "Jack."

JD: "No. It's perfect. She's a genius. One last twist of the knife. Well, thank you for coming, Lemon, but I better get going. The funeral is tomorrow. Colleen wanted to be buried before the rest of the family found out and sold her body to a haunted house. And, of course, I get to eulogize Colleen at the service. One more chance to disappoint her as she looks up at me from her throne in hell."

We'd like to build an 'hedonometer':

An instrument to 'remotely-sense' emotional states and levels, in real time or post hoc.

Ideally:

- Transparent
- Fast
- Based on written expression
- Uses human evaluation
- Non-reactive
- Complementary to self-reported measures
- Improvable

Emotional content

So how does one measure

- happiness?
- levels of other emotional states?

Just ask people how happy they are.

- Experience sampling [5, 7, 6] (Csikszentmihalyi et al.)
- Day reconstruction [19] (Kahneman et al.)

But self-reporting has some drawbacks:

- relies on memory and self-perception
- induces misreporting [26]
- costly

Happiness, attention, and doing:

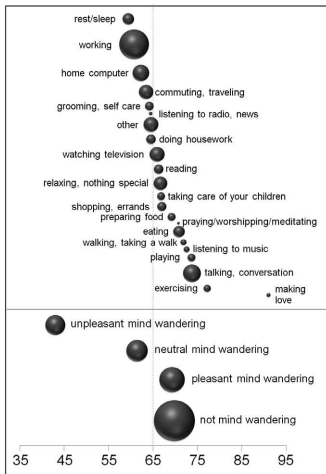

Fig. 1. Mean happiness reported during each activity (top) and while mind wandering to unpleasant topics, neutral topics, pleasant topics or not mind wandering (bottom). Dashed line indicates mean of happiness across all samples. Bubble area indicates the frequency of occurrence. The largest bubble ("not mind wandering") corresponds to 53.1% of the samples, and the smallest bubble ("praying/worshipping/meditating") corresponds to 0.1% of the samples.

ANEW study:

Valence = Happiness:

Valence scale presented to participants as a 'happy-unhappy scale.'

Participants were further told:

"At one extreme of this scale, you are happy, pleased, satisfied, contented, hopeful. ...

The other end of the scale is when you feel completely unhappy, annoyed, unsatisfied, melancholic, despaired, or bored."

Measuring Emotional Content

- Idea:** Build on measures of the emotional content of individual words.
- Osgood et al. (1957) [30] identified a basis of three psychological variables as semantic differentials:
 - Valence:** bad ↔ good
 - Arousal:** passive ↔ active
 - Dominance:** weak ↔ strong
 - Also often: Evaluation, Activity, and Potency.

ANEW study

- ANEW = "Affective Norms for English Words"
- Study: participants shown lists of isolated words
- Asked to grade each word's valence, arousal, and dominance level
- Integer scale of 1-9
- N = 1034 words—previously identified as bearing emotional weight
- Participants = College students (*cough*)
- Results published by Bradley and Lang (1999) [2]

ANEW study words—examples

37 of 155

40 of 155

Song Lyrics—average happiness

Analysing text:

- Simplest measure for a text:

$$\theta_{avg} = \sum_{i=1}^N p_i \theta_i$$

where p_i is fractional abundance of word i and θ is average valence, arousal, or dominance for word i .

- Focus on happiness (valence), $\theta = h$.
- Average happiness typically falls between 5 and 7.

Measuring the perceived happiness of a text:

Lyrics for Michael Jackson's *Billie Jean*

“She was more like a beauty queen from a movie scene.
And mother always told me, be careful who you love.
And be careful of what you do 'cause the lie becomes the truth.
Billie Jean is not my lover, She's just a girl who claims that I am the one.
:

k	ANEW words	v_k	f_k
1	love	8.72	1
2	mother	8.39	1
3	baby	8.22	3
4	beauty	7.82	1
5	truth	7.80	1
6	people	7.33	2
7	strong	7.11	1
8	young	6.89	1
9	girl	6.87	4
10	movie	6.86	1
11	perfume	6.76	1
12	queen	6.44	1
13	name	5.55	1
14	lie	2.79	1

$$v_{text} = \frac{\sum v_k f_k}{\sum f_k}$$

→ $v_{Billie Jean} = 7.1$
→ $v_{Thriller} = 6.3$
→ $v_{Michael Jackson} = 6.4$

- Temperature-like measure—large numbers only.
- Not meant to be used at level of sentence, paragraph, song, tweet, ...
- Important: Social measure of sentiment.
- Later: see instrument is tunable.

Song Lyrics—measurement robustness

100 random subsets of 750 ANEW words

Daft Punk's "Around the World"

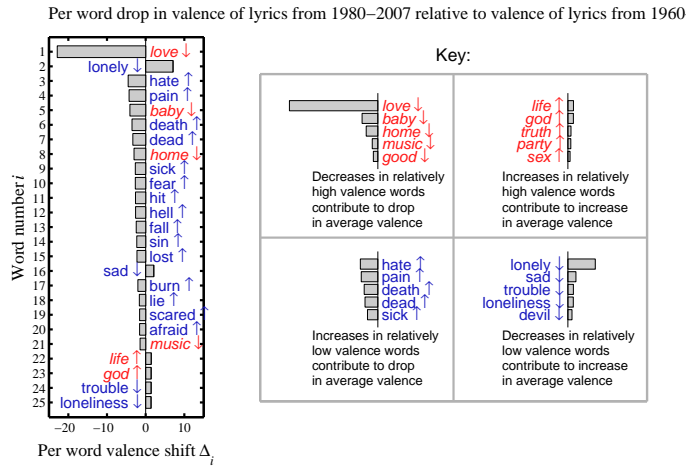

Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world	Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world	Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world
Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world	Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world	Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world
Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world	Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world	Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world
Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world	Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world	Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world

Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world	Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world	Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world
Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world	Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world	Around the world, around the world Around the world, around the world Around the world, around the world Around the world, around the world

Magic: Low entropy, high energy.

Song Lyrics—average happiness of genres:

Happiness Word Shift Graph (early version):

☞ Word shifts are word clouds for grown ups.

Word data shift details:

Given two texts T_{ref} and T_{comp} :

☞ Measure difference in average happiness:

$$h_{avg}^{(comp)} - h_{avg}^{(ref)}$$

☞ Evident question: Which words contribute the most to this change?

☞ Break difference down by contributions from individual words:

$$\delta h_{avg,i} = \frac{100}{h_{avg}^{(comp)} - h_{avg}^{(ref)}} \underbrace{[h_{avg}(w_i) - h_{avg}^{(ref)}]}_{+/-} \underbrace{[p_i^{(comp)} - p_i^{(ref)}]}_{\uparrow/\downarrow}$$

☞ Must have: $\sum_i \delta h_{avg,i} = \pm 100$

☞ Rank words by $|\delta h_{avg,i}|$

Word data shift details:

$$\begin{aligned} h_{avg}^{(comp)} - h_{avg}^{(ref)} &= \sum_{i=1}^N h_{avg}(w_i) p_i^{(comp)} - \sum_{i=1}^N h_{avg}(w_i) p_i^{(ref)} \\ &= \sum_{i=1}^N h_{avg}(w_i) [p_i^{(comp)} - p_i^{(ref)}] \\ &= \sum_{i=1}^N [h_{avg}(w_i) - h_{avg}^{(ref)}] [p_i^{(comp)} - p_i^{(ref)}] \end{aligned}$$

where

$$\begin{aligned} \sum_{i=1}^N h_{avg}^{(ref)} [p_i^{(comp)} - p_i^{(ref)}] &= h_{avg}^{(ref)} \sum_{i=1}^N [p_i^{(comp)} - p_i^{(ref)}] \\ &= h_{avg}^{(ref)} (1 - 1) = 0. \end{aligned}$$

Average happiness as a function of the age bloggers report they will turn in the year of their posting.

Blogs—Latitude

Near equator—social factors

- Increase in 'sad', 'bored', 'lonely', 'stupid', 'guilty'
- Decrease in 'good' and 'people'

Near poles—social/psychological/climate

- Increase in 'sick', 'guilty', 'cold', 'depressed', and 'headache' and decrease of 'love' and 'life.'
- Offset by decrease in 'hurt' and 'pain.'
- More 'bed' and 'sleep.'

Blogs—Age

- Self-report studies find **little variation** in happiness with age [12, 13]
- Surprising: Expect a rise and fall.
- A 'challenge' for theory...
- Related to the **Easterlin Paradox**: **Money doesn't buy happiness**
- But maybe it does a little bit—Veenhoven & Hagerty (2003) and Wolfers & Stevenson (2008).

rednnneecckckkkkkkkk

2013/02/18 at 8:53 pm (Edit)

I've lived in quite a few places. The most recently Beaumont, TX. Its a pure hellhole. Hot, humid, trashy, terrible schools, corrupt government, lots of crime, no public parks or activities, terrible culture (other than crawfish boils), completely lacks diversity. This study confirms my suspicions that cities don't get any more miserabel than this.

"Happiness and the Patterns of Life: A Study of Geolocated Tweets"

Frank, Mitchell, Dodds, Danforth, and Dodds.

Nature Scientific Reports, 3, 2625, 2013. [14]

Figure 6 | (A) Average happiness of words written as a function of distance from an author's expected location, with tweets grouped into ten equally populated bins. Expressed happiness grows logarithmically with distance from expected location. (B) A similar trend is observed when individuals are grouped into ten equally populated bins according to their gyradius. Both trends persist through variations in binning and different measures of mobility.

We grow fonder as we wander.

Anger:

word	avg	σ
war	4.16	1.01
torture	3.92	1.16
murdered	3.84	1.14
motherf**ker	3.82	1.29
anger	3.80	1.26
killer	3.78	1.38
