## Overview

The basic idea/problem/motivation/history:

- Organizations as information exchange entities.
- Catastrophe recovery.
- Solving ambiguous, ill-defined problems.
- Robustness as 'optimal' design feature.

A model of organizational networks:

- Network construction algorithm.
- Task specification.
- Message routing algorithm.

Results:

- Performance measures.

## February, 1997:

Aisin (eye-sheen), maker of brake valve parts for Toyota, burns to ground. [4]

- 4 hours supply ("just in time").
- 14,000 cars per day → 0 cars per day.
- 6 months before new machines would arrive.
- Recovered in 5 days.

- Case study performed by Nishiguchi and Beaudet [4]  
"Fractal Design: Self-organizing Links in Supply Chain"  
in "Knowledge Creation: A New Source of Value"

## February, 1997:

### Some details:

- 🌀 36 suppliers, 150 subcontractors
- 🌀 50 supply lines
- 🌀 Sewing machine maker with no experience in car parts spent about 500 man hours refitting a milling machine to produce 40 valves a day.
- 🌀 Recovery depended on horizontal links which arguably provided:
  1. robustness
  2. searchability

## Motivation

### Recovery from catastrophe involves solving problems that are:

- 🌀 Unanticipated,
- 🌀 Unprecedented,
- 🌀 Ambiguous (nothing is obvious),
- 🌀 Distributed (knowledge/people/resources),
- 🌀 Limited by existing resources,
- 🌀 Critical for survival.

### Frame:

- 🌀 Collective solving of ambiguous problems

## Motivation

### Ambiguity:

- 🌀 Question much less answer is not well understood.
- 🌀 Back and forth search process rephrases question.
- 🌀 Leads to iterative process of query reformulation.
- 🌀 Ambiguous tasks are inherently not decomposable.
- 🌀 How do individuals collectively work on an ambiguous organization-scale problem?
- 🌀 How do we define ambiguity?

## Let's modelify:

### Modeling ambiguous problems is hard...

- Model response instead...
- Individuals need novel information and must communicate with others outside of their usual contacts.
- Creative search is intrinsically inefficient.

### Focus on robustness:

- Avoidance of individual failures.
- Survival of organization even when failures do occur.

## Why organizations exist:

"The Nature of the Firm"  
 Ronald H. Coase,  
*Economica*, **New Series**, 4, 386–405, 1937. [1]

- Notion of Transaction Costs.
- More efficient for individuals to cooperate outside of the market.

Coase had a solid career.

## Real organizations—Extremes

### Hierarchy:

- Maximum efficiency,
- Suited to static environment,
- Brittle.

### Market:

- Resilient,
- Suited to rapidly changing environment,
- Requires costless or low cost interactions.

## Organizations as efficient hierarchies

- Economics: **Organizations  $\equiv$  Hierarchies.**
- e.g., Radner (1993) [5], Van Zandt (1998) [7]
- Hierarchies performing associative operations:

## Real organizations...

But real, complex organizations are in the middle...

"Heterarchy"  
 David Stark,  
*The Biology of Business: Decoding the Natural Laws of the Enterprise.*, **New Series**, 4, 153–, 1999. [6]

## Optimal network topologies for local search

"Optimal network topologies for local search with congestion"  
 Guimerà et al.,  
*Phys. Rev. Lett.*, **89**, 248701, 2002. [3]

- Parallel search and congestion.
- Queueing and network collapse.
- Exploration of random search mechanisms.

# Optimal network topologies for local search

- Betweenness:  $\beta$ .
- Polarization: 
$$\pi = \frac{\max \beta}{\langle \beta \rangle} - 1.$$
- $L$  = number of links.

- Goal: minimize average search time.
- Few searches  $\Rightarrow$  hub-and-spoke network.
- Many searches  $\Rightarrow$  decentralized network.
- Phase transition?

"Information exchange and the robustness of organizational networks" Dodds, Watts, and Sabel, Proc. Natl. Acad. Sci., **100**, 12516–12521, 2003. [2]

Edited by Harrison White

## Formal organizational structure:

- Underlying hierarchy:
  - branching ratio  $b$
  - depth  $L$
  - $N = (b^L - 1)/(b - 1)$  nodes
  - $N - 1$  links
- Additional informal ties:
  - Choose  $m$  links according to a two parameter probability distribution
  - $0 \leq m \leq (N - 1)(N - 2)/2$

# Desirable organizational qualities:

1. Low cost (requiring few links).
2. Scalability.
3. Ease of construction—existence is plausible.
4. Searchability.
5. 'Ultra-robustness':
  - I Congestion robustness (Resilience to failure due to information exchange);
  - II Connectivity robustness (Recoverability in the event of failure).

## Model—construction

Link addition probability:

$$P(D, d_1, d_2) \propto e^{-D/\lambda} e^{-f(d_1, d_2)/\zeta}$$

- First choose  $(D, d_1, d_2)$ .
- Randomly choose  $(y, x_1, x_2)$  given  $(D, d_1, d_2)$ .
- Choose links without replacement.

38 of 61

## Model—construction

Requirements for  $f(d_1, d_2)$ :

1.  $f \geq 0$  for  $d_1 + d_2 \geq 2$
2.  $f$  increases monotonically with  $d_1, d_2$ .
3.  $f(d_1, d_2) = f(d_2, d_1)$ .
4.  $f$  is maximized when  $d_1 = d_2$ .

Simple function satisfying 1–4:

$$f(d_1, d_2) = (d_1^2 + d_2^2 - 2)^{1/2}$$

$$\Rightarrow P(y, x_1, x_2) \propto e^{-D/\lambda} e^{-(d_1^2 + d_2^2 - 2)^{1/2}/\zeta}$$

## Message passing pattern

Simple message routing algorithm:

- Look ahead one step: always choose neighbor closest to recipient node.
- Pseudo-global knowledge:
  1. Nodes understand hierarchy.
  2. Nodes know only local informal ties.

## Message passing pattern

- Each of  $T$  time steps, each node generates a message with probability  $\mu$ .
- Recipient of message chosen based on distance from sender.

$$P(\text{recipient at distance } d) \propto e^{-d/\xi}$$

1.  $\xi$  = measure of uncertainty;
2.  $\xi = 0$ : local message passing;
3.  $\xi = \infty$ : random message passing.

## Message passing pattern

Interpretations:

1. Sender knows specific recipient.
2. Sender requires certain kind of recipient.
3. Sender seeks specific information but recipient unknown.
4. Sender has a problem but information/recipient unknown.

# Message passing pattern

## Performance:

- Measure Congestion Centrality  $\rho_i$ , fraction of messages passing through node  $i$ .
- Similar to betweenness centrality.
- However: depends on
  - Search algorithm;
  - Task specification ( $\mu, \xi$ ).
- Congestion robustness comes from minimizing  $\rho_{max}$ .

# Results—Maximum firm size

- Congestion may increase with size of network.
- Fix rate of message passing ( $\mu$ ) and Message pattern ( $\xi$ ).
- Fix branching ratio of hierarchy and add more levels.
- Individuals have limited capacity  $\Rightarrow$  limit to firm size.

## Connectivity Robustness

CocoNuTS  
@networksvox  
Organizational  
Networks

### Inducing catastrophic failure:

- Remove  $N_r$  nodes and measure relative size of largest component  $C = S/(N - N_r)$ .
- Four deletion sequences:
  1. Top-down;
  2. Random;
  3. Hub;
  4. Cascading failure.
- Results largely independent of sequence.

## Conclusory moments

CocoNuTS  
@networksvox  
Organizational  
Networks

### Multi-scale networks:

1. Possess good Congestion Robustness and Connectivity Robustness  $\Rightarrow$  Ultra-robust;
  2. Scalable;
  3. Relatively insensitive to parameter choice;
- Above suggests existence of multi-scale structure is plausible.

## Conclusory moments

CocoNuTS  
@networksvox  
Organizational  
Networks

- Foregoing is an attempt to model what organizations might look like beyond simple hierarchies (2003).
- Possible work: develop 'bottom up' model of organizational networks based on social search, identity (emergent searchability).
- Balance of generalists versus specialists—how many middle managers does an organization need?
- Still a need for data on real organizations...
