Parallel search and congestion.

Queueing and network collapse.

Exploration of random search mechanisms.

# Optimal network topologies for local search

 Betweenness:  $\beta$ .

 Polarization:

$$\pi = \frac{\max \beta}{\langle \beta \rangle} - 1.$$

  $L$  = number of links.

 Goal: minimize average search time.

 Few searches  $\Rightarrow$  hub-and-spoke network.

 Many searches  $\Rightarrow$  decentralized network.

 Phase transition?
