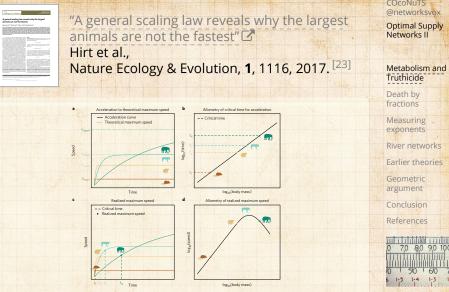

Figure 1 | Concept of time-dependent and mass-dependent realized maximum speed of animals, a. Acceleration of animals follows a saturation curve (solid lines) approaching the theoretical maximum speed (dotted lines) depending on body mass (colour code). b. The time available for acceleration increases with body mass following a power law. c,d, This critical time determines the realized maximum speed (c), yielding a hump-shaped increase of maximum speed with body mass (d).

Relationship to ordinary least squares regression is simple:

 $slope_{SMA} = r^{-1} \times slope_{OLS y \text{ on } x}$ $= r \times slope_{OLS x \text{ on } y}$

where *r* = standard correlation coefficient:

$$r = \frac{\sum_{i=1}^{n} (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^{n} (x_i - \bar{x})^2} \sqrt{\sum_{i=1}^{n} (y_i - \bar{y})^2}}$$

Groovy upshot: If (1) a paper uses OLS regression when RMA would be appropriate, and (2) *r* is reported, we can figure out the RMA slope. ^[41, 29] COcoNuTS @networksvox

The relation of body surface to body weight in vertebrates. The points surrounded by a circle represent beech trees. The authorities of the data are in approximate order of hody sizes of organisms: Fishes Tinca, Esaz, Salaro, Pleuromeetes flesus, Anguilla, Grenilabrus, Lobrug: 0.88 g-2 kg), Jan Bokrus (unpublished). Frogs (3.5-32 g), lisards (3-13 g), Fer, 1914, p. 191. Rang excutence (23 and 50 g), Knosse, 1904, p. 404, Lizards (Locaria muralis and pizidis, Augusts Ingelits: 5-26 g) and Ringed Snake (47-109 g), Isano, 1911, pp. 7-8. Teach (Tison: 211 g), frog (44 g), rabbit (3.6 kg), Very, 1930, no. 239, 244, 245, Dogs (7 and 20 kg), pigs, (3 and 160 kg), horses (175 and 900 kg), monkeys (2.5 and 5.5 kg), man (6 and 65 kg), Bacerr, Converand MATTREWS, 1928, pp. 8, 30, 33 and 51. Snakes (rattle-snake, small and large python, hos: 3.5-32 kg), Busineeur, 1932, p. 145. Rata (20 and 250 g), cattle (20 and 400 kg), Becov, 1945, pp. 360, 361. Giant shark (2.75 1), rhinoseres (1 1), HERRESORES, 1950, pp. 30 and 43. Beech trees without leaves and roots (30 kg-1.3 t), NaLLER, Nucl. sats and Mitage, 1954, tables 2-4 on pp. 277-281.

assuming a specific gravity of 1.0. Naturally, the inclination of this line corresponds to a proportionality power of 0.67.

Of the unicellular organisms represented in fig. 1 not a few are subtrical in shope (the bacterium Sarcella, Saccharomyces, marine errs); and most of the others have surfaces exceeding those of subcress of equal volume by rarely more than what corresponds to 0.1 decade in the log, ordinate system (Photobaclerium nhoushorenernz: 12 %, i.e. 0.05 decade, Escherichia coli: 34 %, i.e. 0.13 decade, the cilintes Colpidium and Paramaccium: 19-22 %, i.e. about 0.08-0.09 decade; calculated on the basis of data of Pörrezs, 1924, table 7 on p. 168, and Hanvey, 1928, table 1). Similar figures probably hold for other ciliates. Only the flagellates represented (Trypanosomidae, Astasia klebsii) and certain amorbae are likely to deviate by higher figures. The surface values of the unicellular organisms represented in fig. 1 will, therefore, fall either on, or in most other cases less than 0.1 decade above, a line representing the relation between surface and volume of spheres.

It will be even from B_0 to that the points representing the host surfaces of the nucleus simulation integration are grouped parallel for hyperter liker) that is, also corresponding to a prosent straight of the sphere liker is that is, also corresponding to a prosent fail and all 20 junctification for the system bar sphere like (B_0 , B_0) times higher in the animality since the sphere like B_0 , B_0

hody surface in $em^2 = k \cdot body$ weight^{0.0}

as tabularized by Biscontev (1985, p. 175) for various birds and manumals weighing 8, g = 44 sky, lecemare this is about double the value of k for sphere surface (4.83). The value of k (13.06) found by Rabeaux (1940) for Averariz is 22 ultrus 4.83, and this corresponds well with the above mentioned figure 3 for the much larger python of similar shape. Impedance measures:

Poiseuille flow (outer branches):

$$Z = \frac{8\mu}{\pi} \sum_{k=0}^{N} \frac{\ell_k}{r_k^4 N_k}$$

Pulsatile flow (main branches):

$$Z \propto \sum_{k=0}^N rac{h_k^{1/2}}{r_k^{5/2}N_k}$$

Wheel out Lagrange multipliers ... Poiseuille gives $P \propto M^1$ with a logarithmic correction.

Pulsatile calculation explodes into flames.

Let's try a quadratic:

$$\log_{10} P \sim \log_{10} c + \alpha_1 \log_{10} M + \alpha_2 \log_{10} M^2$$

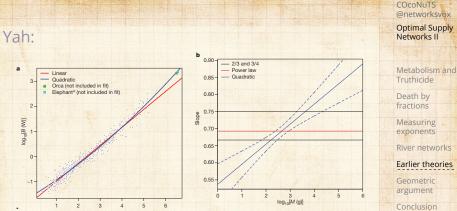

Figure 11 Curvature in metabolic scaling, a , Linear (red) and quadratic (blue) fits (not indinding temperature) of log₂₀ & revus log₂₀. At the orca (green square) and Asian elephant (ref. 4; turquoise square at larger mass) are not included in the fit, but are predicted well. Differences in the quality of fit are best seen in terms of the conditional mean of the error, estimated by the lowers (locally-weighted scatterplot smoothing) fit of the residual Supplementary Information). See Table 1 for the values of the coefficients obtained from the fit. B, Slope of the quadratic fit (including temperature) with pointwise '9% confidence intervals (blue). The slope of the power-law fit (red) and models with fixed 23 and 3/4 exponents (black) are included for comparison. This panel suggests that exponents seturinated by assuming a power law will be highly sensitive to the mass range of the data set used, as shown in Fig. 2.

Find that vessel volume v must scale with vessel length ℓ to affect overall system scalings.

うへで 87 of 126

00

Effecting scaling:

Solution Consider vessel radius $r \propto (\ell + 1)^{-\epsilon}$, tapering from $r = r_{\max}$ where $\epsilon \ge 0$.

Gives
$$v \propto \ell^{1-2\epsilon}$$
 if $\epsilon < 1/2$

Solution Gives
$$v \propto 1 - \ell^{-(2\epsilon-1)} \rightarrow 1$$
 for large ℓ if $\epsilon > 1/2$

Solution Previously, we looked at $\epsilon = 0$ only.

There is an apocryphal story about a graduate mathematics student at the University of Virginia studying the properties of certain mathematical objects. In his fifth year some killjoy bastard elsewhere published a paper proving that there are no such mathematical objects. He dropped out of the program, and I never did hear where

he is today. He's probably making my cappuccino right now.

This week, a professor named Peter Sheridan Dodds published a new paper in *Physical Review Letters* further fleshing out a theory concerning why a 2/3 power law may apply for metabolic rate. The 2/3 law says that metabolic rate in animals rises as the 2/3 power of body mass. It was in a 2001 *Journal of Theoretical Biology* paper that he first argued that perhaps a 2/3 law applies, and that paper – along with others such as the one that Just appeared — is what has put him in the Killjoy Hall of Fame. The University of Virginia's Killjoy was a mere amateur.
