Scalingarama

Archival object:

General observation:

Systems (complex or not) that cross many spatial and temporal scales often exhibit some form of scaling.

Outline—All about scaling:

- Basic definitions.
- Examples.

In CocoNuTs:

- Advances in measuring your power-law relationships.
- Scaling in blood and river networks.
- The Unsolved Allometry Theoricides.

Definitions

A power law relates two variables x and y as follows:

$$y = cx^{\alpha}$$

- α is the scaling exponent (or just exponent)
- $\stackrel{\wedge}{\otimes}$ α can be any number in principle but we will find various restrictions.
- & c is the prefactor (which can be important!)

Scaling-at-large \clubsuit The prefactor c must balance dimensions.

& Imagine the height ℓ and volume v of a family of shapes are related as:

$$\ell = cv^{1/4}$$

Using [·] to indicate dimension, then

$$[c] = [l]/[V^{1/4}] = L/L^{3/4} = L^{1/4}.$$

 \clubsuit More on this later with the Buckingham π theorem.

Good practice: Always, always, always use base 10.

Power-law relationships are linear in log-log space:

 $y = cx^{\alpha}$

 $\Rightarrow \log_b y = \alpha \log_b x + \log_b c$

A Yes, the Dozenalists are right, 12 would be better.

with slope equal to α , the scaling exponent.

Much searching for straight lines on log-log or

But: hands.¹And social pressure.

double-logarithmic plots.

Talk only about orders of magnitude (powers of 10).

少 Q (~ 9 of 104

少 Q (→ 6 of 104 ¹Probably an accident of evolution—debated. PoCS, Vol. 1

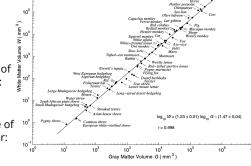

Looking at data

A beautiful, heart-warming example:

& W = volume of white matter: 'wiring'

from Zhang & Sejnowski, PNAS (2000)[37]

少 Q (~ 7 of 104

Why is $\alpha \simeq 1.23$?

Quantities (following Zhang and Sejnowski):

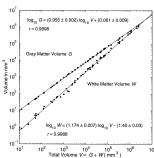

- W = Volume of white matter (wiring)
- Rrightarrow T = Cortical thickness (wiring)
- S = Cortical surface area
- & L = Average length of white matter fibers
- p = density of axons on white matter/cortexinterface

A rough understanding:

- $G \sim ST$ (convolutions are okay)

- \clubsuit We are here: $W \propto G^{4/3}/T$
- & Observe weak scaling $T \propto G^{0.10\pm0.02}$.
- $\@ifnextchar[{\@model{A}}{\@model{A}}$ Implies $S \propto G^{0.9} \to \text{convolutions fill space}$.

Tricksiness:

- Measuring exponents is a hairy business...

PoCS, Vol. 1 Disappointing deviations from scaling: @pocsvox Scaling

- Per George Carlin 🖸
- A Yes, should be the median. #painful

Image from here ☑

The koala , a few roos short in the top paddock:

- Wery small brains
 Telative to body size. Wrinkle-free, smooth.
- Not many algorithms needed:
 - Only eat eucalyptus leaves (no water) (Will not eat leaves picked and presented to them)
 - Move to the next tree.
 - Sleep.
 - Defend themselves if needed (tree-climbing crocodiles, humans).
 - Occasionally make more koalas.

Definitions

Power laws are the signature of scale invariance:

Scale invariant 'objects' look the 'same' when they are appropriately rescaled.

- Objects = geometric shapes, time series, functions, relationships, distributions,...
- & 'Same' might be 'statistically the same'
- To rescale means to change the units of measurement for the relevant variables

$\Rightarrow y' = cx'^{\alpha}$

 $y = ce^{-\lambda rx'}$

Scale invariance

Our friend $y = cx^{\alpha}$:

Scale invariance

Compare with $y = ce^{-\lambda x}$:

 \Re If we rescale x as x = rx', then

Original form cannot be recovered.

Scale matters for the exponential.

If we rescale x as x = rx' and y as $y = r^{\alpha}y'$,

备 then

 $r^{\alpha}y' = c(rx')^{\alpha}$

2 9 0 19 of 104

- $\mathcal{L} G = \text{Volume of gray matter (cortex/processors)}$

- $\Re W \sim \frac{1}{2}pSL$
- $G \sim L^3 \leftarrow$ this is a little sketchy...
- \Leftrightarrow Eliminate S and L to find $W \propto G^{4/3}/T$

Why is $\alpha \simeq 1.23$?

A rough understanding:

- \Longrightarrow With V = G + W, some power laws must be approximations.

General rules of thumb:

Good scaling:

A High quality: scaling persists over three or more orders of magnitude for each variable.

- A Medium quality: scaling persists over three or more orders of magnitude for only one variable and at least one for the other.
- & Very dubious: scaling 'persists' over less than an order of magnitude for both variables.

少 Q (№ 13 of 104

Average walking speed as a function of city population:

Two problems:

- 1. use of natural log, and
- 2. minute varation in dependent variable.
- from Bettencourt et al. (2007) [4]; otherwise totally great-more later.

UM S •9 q (> 16 of 104

Isometry:

Dimensions scale linearly with each other.

Allometry:

Dimensions scale nonlinearly.

Allometry: ☑

- Refers to differential growth rates of the parts of a living organism's body part or process.
- First proposed by Huxley and Teissier, Nature, 1936 "Terminology of relative growth" [15, 33]

Definitions

Isometry versus Allometry:

- & Iso-metry = 'same measure'
- Allo-metry = 'other measure'

We use allometric scaling to refer to both:

- 1. Nonlinear scaling of a dependent variable on an independent one (e.g., $y \propto x^{1/3}$)
- 2. The relative scaling of correlated measures (e.g., white and gray matter).

A little formalism:

- Game: find all possible independent combinations of the $\{q_1,q_2,\dots,q_n\}$, that form dimensionless quantities $\{\pi_1, \pi_2, \dots, \pi_p\}$, where we need to figure out p (which must be < n).
- \Leftrightarrow Consider $\pi_i = q_1^{x_1} q_2^{x_2} \cdots q_n^{x_n}$.
- & We (desperately) want to find all sets of powers x_i that create dimensionless quantities.
- $\text{ Dimensions: want } [\pi_i] = [q_1]^{x_1} [q_2]^{x_2} \cdots [q_n]^{x_n} = 1.$
- For the platypus pendulum we have $[q_1] = L$, $[q_2] = M$, $[q_3] = LT^{-2}$, and $[q_4] = T$, with dimensions $d_1 = L$, $d_2 = M$, and $d_3 = T$.
- \mathfrak{So} : $[\pi_i] = L^{x_1} M^{x_2} (LT^{-2})^{x_3} T^{x_4}$.
- \Re We regroup: $[\pi_i] = L^{x_1+x_3}M^{x_2}T^{-2x_3+x_4}$.
- $x_1 + x_3 = 0$, $x_2 = 0$, and $-2x_3 + x_4$.
- Time for matrixology ...

Well, of course there are matrices:

Thrillingly, we have:

$$\mathbf{A}\vec{x} = \left[\begin{array}{ccc} 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -2 & 1 \end{array}\right] \left[\begin{array}{c} x_1 \\ x_2 \\ x_3 \\ x_4 \end{array}\right] = \left[\begin{array}{c} 0 \\ 0 \\ 0 \end{array}\right]$$

- \clubsuit A nullspace equation: $\mathbf{A}\vec{x} = \vec{0}$.
- Number of dimensionless parameters = Dimension of null space = n-r where n is the number of columns of **A** and r is the rank of **A**.
- \clubsuit Here: n=4 and $r=3 \rightarrow F(\pi_1)=0 \rightarrow \pi_1$ = const.
- \mathbb{A} In general: Create a matrix **A** where ijth entry is the power of dimension i in the ith variable, and solve by row reduction to find basis null vectors.
- \Re We (you) find: $\pi_1 = \ell/g\tau^2 = \text{const.}$ Upshot: $\tau \propto \sqrt{\ell}$. Insert question from assignment 1 2

"Scaling, self-similarity, and intermediate asymptotics" 3, 2

by G. I. Barenblatt (1996). [2]

G. I. Taylor, magazines, and classified secrets:

Self-similar blast wave:

- \Re Radius: [R] = L, Time: [t] = T, Density of air: $[\rho] = M/L^3$, Energy: $[E] = ML^2/T^2$.
- Four variables, three dimensions.
- One dimensionless variable: $E = \text{constant} \times \rho R^5/t^2$.
- \mathfrak{S} Scaling: Speed decays as $1/R^{3/2}$.

Scaling-at-large

In 1941, Kolmogorov, armed only with dimensional analysis and an envelope figures this out: [?]

$$E(k) = C\epsilon^{2/3}k^{-5/3}$$

- & E(k) = energy spectrum function.
- & ϵ = rate of energy dissipation.
- $k = 2\pi/\lambda = wavenumber.$
- Energy is distributed across all modes, decaying with wave number.
- No internal characteristic scale to turbulence.
- Stands up well experimentally and there has been no other advance of similar magnitude.

"The Geometry of Nature": Fractals 🗹

- "Anomalous" scaling of lengths, areas, volumes relative to each other.
- The enduring question: how do self-similar geometries form?
- Robert E. Horton : Self-similarity of river (branching) networks (1945). [13]
- A Harold Hurst —Roughness of time series (1951). [14]
- Lewis Fry Richardson —Coastlines (1961).
- Benoît B. Mandelbrot ☑—Introduced the term "Fractals" and explored them everywhere, 1960s on. [21, 22, 23]

dNote to self: Make millions with the "Fractal Diet"

Scaling in Cities:

"Urban scaling and its deviations: Revealing the structure of wealth, innovation and crime across cities" Bettencourt et al., PLoS ONE, **5**, e13541, 2010. [5]

Comparing city features across populations:

- Cities = Metropolitan Statistical Areas (MSAs)
- Story: Fit scaling law and examine residuals
- Does a city have more or less crime than expected when normalized for population?
- Same idea as Encephalization Quotient (EQ).

Non-simple scaling for death: "Statistical signs of social influence on

suicides" 🗹 Melo et al.. Scientific Reports, 4, 6239, 2014. [26]

- Bettencourt et al.'s initial work suggested social phenomena would follow superlinear scaling (wealth, crime, disease)
- A Homicide, traffic, and suicide [10] all tied to social context in complex, different ways.
- For cities in Brazil, Melo et al. show:
 - Homicide appears to follow superlinear scaling $(\beta = 1.24 \pm 0.01)$
 - Traffic accident deaths appear to follow linear scaling ($\beta = 0.99 \pm 0.02$)
 - Suicide appears to follow sublinear scaling.

Scaling in Cities:

Intriguing findings:

- \clubsuit Global supply costs scale sublinearly with N $(\beta < 1)$.
 - Returns to scale for infrastructure.
- $\red{8}$ Total individual costs scale linearly with N ($\beta = 1$)
 - Individuals consume similar amounts independent of city size.
- & Social quantities scale superlinearly with N ($\beta > 1$)
 - Creativity (# patents), wealth, disease, crime, ...

Density doesn't seem to matter...

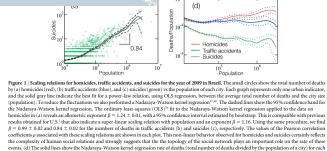

Surprising given that across the world, we observe two orders of magnitude variation in area covered by agglomerations of fixed populations.

A possible theoretical explanation?

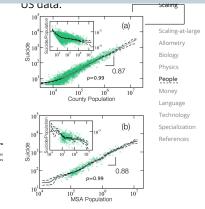

"The origins of scaling in cities" Luís M. A. Bettencourt, Science, **340**, 1438–1441, 2013. [3]

#sixthology

urban indicator, namely, homicides (red), traffic accidents (blue), and suicides (green). The dashed lines represent the 95% confidence bands. While the rate of fatal traffic accidents remains approximately invariant, the rate of homicides systematically increases, and the rate of suicides decreases with
