## The lognormal distribution:

$$P(x) = \frac{1}{x\sqrt{2\pi}\sigma} \exp\left(-\frac{(\ln\!x - \mu)^2}{2\sigma^2}\right)$$

- $\Re$  lnx is distributed according to a normal distribution with mean  $\mu$  and variance  $\sigma$ .
- Appears in economics and biology where growth increments are distributed normally.

The PoCSverse Lognormals and friends 8 of 26

Lognormals Empirical Confusability

Random Multiplicativ Growth Model Random Growth with

 $\clubsuit$  Standard form reveals the mean  $\mu$  and variance  $\sigma^2$ of the underlying normal distribution:

$$P(x) = \frac{1}{x\sqrt{2\pi}\sigma} \exp\left(-\frac{(\ln x - \mu)^2}{2\sigma^2}\right)$$

The PoCSverse Lognormals and friends 9 of 26

Lognormals **Empirical Confusability** 

Growth Model

& Standard form reveals the mean  $\mu$  and variance  $\sigma^2$  of the underlying normal distribution:

$$P(x) = \frac{1}{x\sqrt{2\pi}\sigma} \exp\left(-\frac{(\ln x - \mu)^2}{2\sigma^2}\right)$$

For lognormals:

$$\begin{split} \mu_{\rm lognormal} &= e^{\mu + \frac{1}{2}\sigma^2}, \qquad {\rm median}_{\rm lognormal} = e^{\mu}, \\ \sigma_{\rm lognormal} &= (e^{\sigma^2} - 1)e^{2\mu + \sigma^2}, \qquad {\rm mode}_{\rm lognormal} = e^{\mu - \sigma^2}. \end{split}$$

The PoCSverse Lognormals and friends 9 of 26

Lognormals

Empirical Confusability Random Multiplicative Growth Model

Random Growth wit Variable Lifespan

 $\ref{Standard}$  Standard form reveals the mean  $\mu$  and variance  $\sigma^2$  of the underlying normal distribution:

$$P(x) = \frac{1}{x\sqrt{2\pi}\sigma} \exp\left(-\frac{(\ln x - \mu)^2}{2\sigma^2}\right)$$

For lognormals:

$$\mu_{\rm lognormal} = e^{\mu + \frac{1}{2}\sigma^2}, \qquad {\rm median}_{\rm lognormal} = e^{\mu},$$

$$\sigma_{\rm lognormal} = (e^{\sigma^2} - 1)e^{2\mu + \sigma^2}, \qquad {\rm mode}_{\rm lognormal} = e^{\mu - \sigma^2}.$$

All moments of lognormals are finite.

Variable Lifespan

## Ages of firms/people/... may not be the same

- $\ \,$  Allow the number of updates for each size  $x_i$  to vary
- $\Leftrightarrow$  Example:  $P(t)dt = ae^{-at}dt$  where t = age.
- $\ \, \& \ \,$  Back to no bottom limit: each  $x_i$  follows a lognormal
- Sizes are distributed as [6]

$$P(x) = \int_{t=0}^{\infty} a e^{-at} \frac{1}{x\sqrt{2\pi t}} \exp\left(-\frac{(\ln x - \mu)^2}{2t}\right) \mathrm{d}t$$

(Assume for this example that  $\sigma \sim t$  and  $\mu = \ln m$ )
