## February, 1997:

Aisin (eye-sheen), maker of brake valve parts for Toyota, burns to ground.<sup>[4]</sup>

- 4 hours supply (“just in time”).
- 14,000 cars per day → 0 cars per day.
- 6 months before new machines would arrive.
- Recovered in 5 days.

Case study performed by Nishiguchi and Beaudet<sup>[4]</sup>  
“Fractal Design: Self-organizing Links in Supply Chain”  
in “Knowledge Creation: A New Source of Value”

## Outline

### Overview

Toyota  
Ambiguous problems  
Models of organizations:

### Modelification

Goals  
Model  
Testing  
Results

### Conclusion

### References

## Overview

The basic idea/problem/motivation/history:

- Organizations as information exchange entities.
- Catastrophe recovery.
- Solving ambiguous, ill-defined problems.
- Robustness as ‘optimal’ design feature.

A model of organizational networks:

- Network construction algorithm.
- Task specification.
- Message routing algorithm.

### Results:

- Performance measures.

## February, 1997:

Some details:

- 36 suppliers, 150 subcontractors
- 50 supply lines
- Sewing machine maker with no experience in car parts spent about 500 man hours refitting a milling machine to produce 40 valves a day.
- Recovery depended on horizontal links which arguably provided:
  - robustness
  - searchability

## Rebirth:

## Some things fall apart:

## Motivation

Recovery from catastrophe involves solving problems that are:

- Unanticipated,
- Unprecedented,
- Ambiguous (nothing is obvious),
- Distributed (knowledge/people/resources),
- Limited by existing resources,
- Critical for survival.

### Frame:

- Collective solving of ambiguous problems

# Motivation

## Ambiguity:

- Question much less answer is not well understood.
- Back and forth search process rephrases question.
- Leads to iterative process of query reformulation.
- Ambiguous tasks are inherently not decomposable.
- How do individuals collectively work on an ambiguous organization-scale problem?
- How do we define ambiguity?

PoCS

## Let's modelify:

### Modeling ambiguous problems is hard...

- Model response instead...
- Individuals need novel information and must communicate with others outside of their usual contacts.
- Creative search is intrinsically inefficient.

PoCS

### Focus on robustness:

- Avoidance of individual failures.
- Survival of organization even when failures do occur.

## Why organizations exist:

"The Nature of the Firm"  
Ronald H. Coase,  
Economica, **New Series**, 4, 386–405, 1937. [1]

- Notion of **Transaction Costs**.
- More efficient for individuals to cooperate outside of the market.

# Real organizations—Extremes

## Hierarchy:

- Maximum efficiency,
- Suited to static environment,
- Brittle.

## Market:

- Resilient,
- Suited to rapidly changing environment,
- Requires costless or low cost interactions.

## Organizations as efficient hierarchies

- Economics: **Organizations  $\equiv$  Hierarchies.**
- e.g., Radner (1993) [5], Van Zandt (1998) [7]
- Hierarchies performing associative operations:

## Real organizations...

But real, complex organizations are in the middle...

"Heterarchy"  
David Stark,  
The Biology of Business: Decoding the  
Natural Laws of the Enterprise., **New  
Series**, 4, 153–, 1999. [6]

## Optimal network topologies for local search

"Optimal network topologies for local search with congestion"  
Guimerà et al.,  
Phys. Rev. Lett., **89**, 248701, 2002. [3]

- Parallel search and congestion.
- Queueing and network collapse.
- Exploration of random search mechanisms.

20 of 59

## Optimal network topologies for local search

- Betweenness:  $\beta$ .
- Polarization:  
$$\pi = \frac{\max \beta}{\langle \beta \rangle} - 1.$$
- $L$  = number of links.

- Goal: minimize average search time.
- Few searches  $\Rightarrow$  hub-and-spoke network.
- Many searches  $\Rightarrow$  decentralized network.
- Phase transition?

## Desirable organizational qualities:

- Low cost (requiring few links).
- Scalability.
- Ease of construction—existence is plausible.
- Searchability.
- 'Ultra-robustness':**
  - I Congestion robustness** (Resilience to failure due to information exchange);
  - II Connectivity robustness** (Recoverability in the event of failure).

# Searchability

## Small world problem:

- Can individuals pass a message to a target individual using only personal connections?
- Yes, large scale networks searchable if nodes have identities.
- "Identity and Search in Social Networks," Watts, Dodds, & Newman, 2002. [8]

Edited by Harrison White

## Formal organizational structure:

### Underlying hierarchy:

- branching ratio  $b$
- depth  $L$
- $N = (b^L - 1)/(b - 1)$  nodes
- $N - 1$  links

### Additional informal ties:

- Choose  $m$  links according to a two parameter probability distribution
- $0 \leq m \leq (N - 1)(N - 2)/2$

## Model—underlying hierarchy

### Model—formal structure:

$$b = 3, \quad L = 3, \quad N = 13$$

# Model—construction

- Link addition probability:

$$P(D, d_1, d_2) \propto e^{-D/\lambda} e^{-f(d_1, d_2)/\zeta}$$

- First choose  $(D, d_1, d_2)$ .
- Randomly choose  $(y, x_1, x_2)$  given  $(D, d_1, d_2)$ .
- Choose links without replacement.

# Message passing pattern

- Each of  $T$  time steps, each node generates a message with probability  $\mu$ .
- Recipient of message chosen based on distance from sender.

$$P(\text{recipient at distance } d) \propto e^{-d/\xi}$$

- $\xi = \text{measure of uncertainty}$ ;
- $\xi = 0$ : local message passing;
- $\xi = \infty$ : random message passing.

# Model—construction

Requirements for  $f(d_1, d_2)$ :

- $f \geq 0$  for  $d_1 + d_2 \geq 2$
- $f$  increases monotonically with  $d_1, d_2$ .
- $f(d_1, d_2) = f(d_2, d_1)$ .
- $f$  is maximized when  $d_1 = d_2$ .

Simple function satisfying 1-4:

$$f(d_1, d_2) = (d_1^2 + d_2^2 - 2)^{1/2}$$

$$\Rightarrow P(y, x_1, x_2) \propto e^{-D/\lambda} e^{-(d_1^2 + d_2^2 - 2)^{1/2}/\zeta}$$

# Message passing pattern

Simple message routing algorithm:

- Look ahead one step: always choose neighbor closest to recipient node.
- Pseudo-global knowledge:
  - Nodes understand hierarchy.
  - Nodes know only local informal ties.

# Message passing pattern

Interpretations:

- Sender knows specific recipient.
- Sender requires certain kind of recipient.
- Sender seeks specific information but recipient unknown.
- Sender has a problem but information/recipient unknown.

# Message passing pattern

Performance:

- Measure Congestion Centrality  $\rho_i$ , fraction of messages passing through node  $i$ .
- Similar to betweenness centrality.
- However: depends on
  - Search algorithm;
  - Task specification  $(\mu, \xi)$ .
- Congestion robustness comes from minimizing  $\rho_{\max}$ .

# Performance testing:

Parameter settings (unless varying):

- Underlying hierarchy:  $b = 5, L = 6, N = 3096$ ;
- Number of informal ties:  $m = N$ .
- Link addition algorithm:  $\lambda = \zeta = 0.5$ .
- Message passing:  $\xi = 1, \mu = 10/N, T = 1000$ .

## Results—congestion robustness

## Results—Maximum firm size

- Congestion may increase with size of network.
- Fix rate of message passing ( $\mu$ ) and Message pattern ( $\xi$ ).
- Fix branching ratio of hierarchy and add more levels.
- Individuals have limited capacity  $\Rightarrow$  limit to firm size.

## Results—Connectivity Robustness

## Results—varying number of links added:

## Scalability in complete uncertainty: $\xi = \infty$

## Summary of results

Feature	Congestion Robustness	Connectivity Robustness	Scalability
Core-periphery	good	average	average
Random	poor	good	poor
Rand. Interdivisional	poor	good	poor
Team-based	poor	poor	poor
Multiscale	good	good	good

## Results—varying message passing pattern

## Connectivity Robustness

### Inducing catastrophic failure:

- Remove  $N_r$  nodes and measure relative size of largest component  $C = S/(N - N_r)$ .
- Four deletion sequences:
  - Top-down;
  - Random;
  - Hub;
  - Cascading failure.
- Results largely independent of sequence.

## Conclusory moments

### Multi-scale networks:

- Possess good Congestion Robustness and Connectivity Robustness  $\Rightarrow$  Ultra-robust;
  - Scalable;
  - Relatively insensitive to parameter choice;
- Above suggests existence of multi-scale structure is plausible.

## Conclusary moments

- Foregoing is an attempt to model what organizations might look like beyond simple hierarchies (2003).
- Possible work: develop 'bottom up' model of organizational networks based on social search, identity (emergent searchability).
- Balance of **generalists versus specialists**—how many middle managers does an organization need?
- Still a need for data on real organizations...
