# Looking at data

Power-law relationships are linear in log-log space:

$$y = cx^{\alpha}$$

$$\Rightarrow \log_b y = \alpha \log_b x + \log_b c$$

with slope equal to  $\alpha$ , the scaling exponent.

- Much searching for straight lines on log-log or double-logarithmic plots.
- Good practice: Always, always, always use base 10.
- A Yes, the Dozenalists are right, 12 would be better.
- But: hands. And social pressure.
- Talk only about orders of magnitude (powers of 10).

<sup>20 11</sup> of 106

<sup>&</sup>lt;sup>1</sup>Probably an accident of evolution—debated.

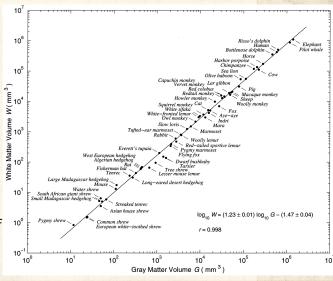

# A beautiful, heart-warming example:

W = volume of white matter: 'wiring'

# Why is $\alpha \simeq 1.23$ ?

#### Quantities (following Zhang and Sejnowski):

G = Volume of gray matter (cortex/processors)

 $\gg W =$ Volume of white matter (wiring)

T = Cortical thickness (wiring)

S = Cortical surface area

L = Average length of white matter fibers

 $\gg p$  = density of axons on white matter/cortex interface

### A rough understanding:

 $G \sim ST$  (convolutions are okay)

 $\Leftrightarrow W \sim \frac{1}{2}pSL$ 

 $G \sim L^3 \leftarrow$  this is a little sketchy...

 $\clubsuit$  Eliminate S and L to find  $W \propto G^{4/3}/T$

# Why is $\alpha \simeq 1.23$ ?

#### A rough understanding:

- $\clubsuit$  We are here:  $W \propto G^{4/3}/T$
- $\clubsuit$  Observe weak scaling  $T \propto G^{0.10\pm0.02}$ .
- $\Longrightarrow$  Implies  $S \propto G^{0.9} \rightarrow$  convolutions fill space.
- $\Longrightarrow W \propto G^{4/3}/T \propto G^{1.23\pm0.02}$

# Good scaling:

Pocs @pocsvox Scaling

#### General rules of thumb:

High quality: scaling persists over three or more orders of magnitude for each variable.

Medium quality: scaling persists over three or more orders of magnitude for only one variable and at least one for the other.

Very dubious: scaling 'persists' over less than an order of magnitude for both variables.

Specialization

#### Scale invariance

## Compare with $y = ce^{-\lambda x}$ :

A If we rescale x as x = rx', then

$$y = ce^{-\lambda rx'}$$

- Original form cannot be recovered.
- Scale matters for the exponential.

More on  $y = ce^{-\lambda x}$ :

- $\Rightarrow$  Say  $x_0 = 1/\lambda$  is the characteristic scale.
- $\clubsuit$  For  $x \gg x_0$ , y is small, while for  $x \ll x_0$ , y is large.

少 Q № 24 of 106

# The many scales of life:

The biggest living things (left). All the organisms are drawn to the same scale. 1. The largest flying bird (albatross); 2, the largest known animal (the blue whale), 3, the largest extinct land mammal (Baluchitherium) with a human figure shown for scale; 4, the tallest living land animal (giraffe); 5. Tyrannosaurus; 6, Diplodocus; 7, one of the largest flying reptiles (Pteranodon); 8, the largest extinct snake; 9, the length of the largest tapeworm found in man; 10, the largest living reptile (West African crocodile): 11, the largest extinct lizard; 12, the largest extinct bird (Aepyornis); 13, the largest jellyfish (Cyanea); 14, the largest living lizard (Komodo dragon); 15, sheep; 16, the largest bivalve mollusc (Tridacna); 17; the largest fish (whale shark); 18, horse; 19, the largest crustacean (Japanese spider crab): 20, the largest sea scorpion (Eurypterid): 21, large tarpon: 22, the largest lobster: 23, the largest mollusc (deep-water squid. Architeuthis): 24. ostrich; 25, the lower 105 feet of the largest organism (giant sequoia), with a 100-foot larch superposed.

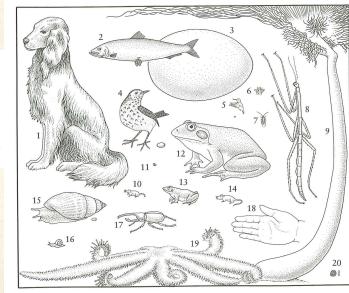

#### p. 2, McMahon and Bonner [26]

# The many scales of life:

Medium-sized creatures (above). 1, Dog; 2, common herring; 3, the largest egg (Aepyornis); 4, song thrush with egg; 5, the smallest bird (hummingbird) with egg; 6, queen bee; 7, common cockroach; 8, the largest stick insect; 9, the largest polyp (Branchiocerianthus); 10, the smallest marmal (flying shrew); 17, the smallest vertebrate (a tropical frog); 12, the largest forg (goliath frog); 13, common grass frog; 14, house mouse; 15, the largest land snail (Achatina) with egg; 16, common snail; 72, the largest beetle (goliath beetle); 18, human hand; 79, the largest starfish (Luidia); 20, the largest free-moving protozoan (an explicit nummulite).

# p. 3, McMahon and Bonner [26] More on the Elephant Bird here ...

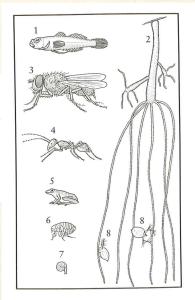

# The many scales of life:

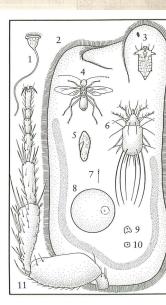

Small, "naked-eye" creatures (lower left).

1, One of the smallest fishes (Trimmatom narus); 2, common brown hydra, expanded; 3, housefly; 4, medium-sized and; 5, the smallest vertebrate (a tropical frog, the same as the one numbered 11 in the figure above); 6, flea (Xenopsylla cheopis); 7, the smallest land snail; 8, common water flea (Daphnia).

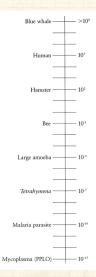

The smallest "naked-eye" creatures and some large microscopic animals and cells (below right). 1, Vorticella, a cliate? 2, the largest cliate protozona (Bursaña); 3, the smallest frampy-celled animal (a rotifer); 4, smallest frijng insect (Elaphis); 5, another cliate (Parameclum); 6, cheese mite; 7, human sperm, 8, human ovum; 9, dysentery amoeba; 10, human liver cell; 17, the cure to the Infea. (umbreed 6 in the figure to the Infea.)

# Dimensional Analysis:4

### Fundamental equations cannot depend on units:

- $\ref{System}$  System involves n related quantities with some unknown equation  $f(q_1,q_2,\ldots,q_n)=0.$
- Rewrite as a relation of  $p \le n$  independent dimensionless parameters  $\square$  where p is the number of independent dimensions (mass, length, time, luminous intensity ...):

$$F(\pi_1,\pi_2,\dots,\pi_p)=0$$

- $\clubsuit$  e.g.,  $A/\ell^2 1 = 0$  where  $\pi_1 = A/\ell^2$ .
- Another example:  $F = ma \Rightarrow F/ma 1 = 0$ .
- Plan: solve problems using only backs of envelopes.

Technology

Specialization

#### A little formalism:

Game: find all possible independent combinations of the  $\{q_1,q_2,\ldots,q_n\}$ , that form dimensionless quantities  $\{\pi_1,\pi_2,\ldots,\pi_p\}$ , where we need to figure out p (which must be  $\leq n$ ).

 $\Leftrightarrow$  Consider  $\pi_i = q_1^{x_1} q_2^{x_2} \cdots q_n^{x_n}$ .

 $\ref{Model}$  We (desperately) want to find all sets of powers  $x_j$  that create dimensionless quantities.

 $\mbox{\ensuremath{\&}}$  Dimensions: want  $[\pi_i] = [q_1]^{x_1} [q_2]^{x_2} \cdots [q_n]^{x_n} = 1.$ 

For the platypus pendulum we have  $[q_1]=L, \ [q_2]=M, \ [q_3]=LT^{-2}, \ \text{and} \ [q_4]=T,$  with dimensions  $d_1=L, \ d_2=M, \ \text{and} \ d_3=T.$ 

3 We now need:  $x_1 + x_3 = 0$ ,  $x_2 = 0$ , and  $-2x_3 + x_4 = 0$ .

Time for matrixology ...

#### Well, of course there are matrices:

Thrillingly, we have:

$$\mathbf{A}\vec{x} = \left[ \begin{array}{ccc} 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -2 & 1 \end{array} \right] \left[ \begin{array}{c} x_1 \\ x_2 \\ x_3 \\ x_4 \end{array} \right] = \left[ \begin{array}{c} 0 \\ 0 \\ 0 \end{array} \right]$$

- $\red{ }$  A nullspace equation:  $\mathbf{A}\vec{x}=\vec{0}.$
- Number of dimensionless parameters = Dimension of null space = n r where n is the number of columns of **A** and r is the rank of **A**.
- $\clubsuit$  Here: n=4 and  $r=3 \to F(\pi_1)=0 \to \pi_1$  = const.
- In general: Create a matrix  $\mathbf{A}$  where ijth entry is the power of dimension i in the jth variable, and solve by row reduction to find basis null vectors.
- We (you) find:  $\pi_1 = \ell/g\tau^2 = \text{const.}$  Upshot:  $\tau \propto \sqrt{\ell}$ . Insert question from assignment 2

## Advances in turbulence:

In 1941, Kolmogorov, armed only with dimensional analysis and an envelope figures this out: [18]

$$E(k) = C\epsilon^{2/3}k^{-5/3}$$

& E(k) = energy spectrum function.

Energy is distributed across all modes, decaying with wave number.

No internal characteristic scale to turbulence.

Stands up well experimentally and there has been no other advance of similar magnitude.

## Scaling in Cities:

#### Intriguing findings:

- Global supply costs scale sublinearly with N ( $\beta < 1$ ).
  - Returns to scale for infrastructure.
- - Individuals consume similar amounts independent of city size.
- Social quantities scale superlinearly with N ( $\beta > 1$ )
  - Creativity (# patents), wealth, disease, crime, ...

## Density doesn't seem to matter...

Surprising given that across the world, we observe two orders of magnitude variation in area covered by agglomerations of fixed populations.

## Non-simple scaling for death:

"Statistical signs of social influence on suicides"

Melo et al., Scientific Reports, **4**, 6239, 2014. [27]

- Homicide, traffic, and suicide [10] all tied to social context in complex, different ways.
- For cities in Brazil, Melo et al. show:
  - Homicide appears to follow superlinear scaling  $(\beta = 1.24 \pm 0.01)$
  - Traffic accident deaths appear to follow linear scaling ( $\beta = 0.99 \pm 0.02$ )
  - Suicide appears to follow sublinear scaling. ( $\beta = 0.84 \pm 0.02$ )

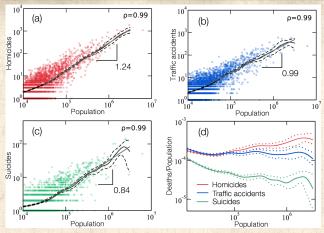

Figure 1 | Scaling relations for homicides, traffic accidents, and suicides for the year of 2009 in Brazil. The small circles show the total number of deaths by (a) homicides (red), (b) traffic accidents (blue), and (c) suicides (green) vs the population of each city. Each graph represents only one urban indicator, and the solid gray line indicate the best fit for a power-law relation, using OLS regression, between the average total number of deaths and the city size (population). To reduce the fluctuations we also performed a Nadaraya-Watson kernel regression<sup>17,18</sup>. The dashed lines show the 95% confidence band for the Nadaraya-Watson kernel regression applied to the data on homicides in (a) reveals an allometric exponent  $\beta = 1.24 \pm 0.01$ , with a 95% confidence interval estimated by bootstrap. This is compatible with previous results obtained for U.S.\* that also indicate a super-linear scaling relation with population and an exponent  $\beta = 1.16$ . Using the same procedure, we find  $\beta = 0.99 \pm 0.02$  and 0.84  $\pm 0.02$  for the numbers of deaths in traffic accidents (b) and suicides (c), respectively. The values of the Pearson correlation coefficients  $\rho$  associated with these scaling relations are shown in each plot. This non-linear behavior observed for homicides and suicides certainly reflects the complexity of human social relations and strongly suggests that the the topology of the social network plays an important role on the rate of these events. (d) The solid lines show the Nadaraya-Watson kernel regression rate of deaths (total number of deaths divided by the population of a city) for each urban indicator, namely, homicides (red), traffic accidents (blue), and suicides (green). The dashed lines represent the 95% confidence bands. While the rate of fatal traffic accidents remains approximately invariant, the rate of homicides systematically increases, and the rate of suicides decreases with population.

#### Dynamics (Brazil):

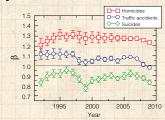

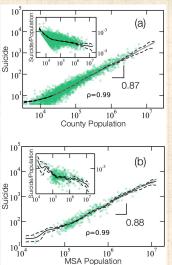

Figure 2 | Temporal evolution of allometric exponent  $\beta$  for homicides (red squares), deaths in traffic accidents (blue circles), and suicides (green diamonds). Time evolution of the power-law exponent  $\beta$  for each behavioral urban indicator in Brazil from 1992 to 2009. We can see that the non-linear behavior for homicides and suicides are robust for this 19 years period, and for the traffic accidents the exponent remain close to 1.0.

#### "Pattern in escalations in insurgent and terrorist activity"

Johnson et al., Science, 333, 81-84, 2011. [16]

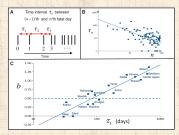

Fig. 1. (A) Schematic timeline of successive fatal days shown as vertical bars. \(\tau\_1\) is the time interval between the first two fatal days, labeled 0 and 1. (B) Successive time intervals to between days with IED fatalities in the Afghanistan province of Kandahar (squares). On this log-log plot, the best-fit power-law progress curve is by definition a straight (blue) line with slope -b (b is an escalation rate). (C) The solid blue line shows best linear fit through progress-curve parameter values t<sub>1</sub> and b for individual Afghanistan provinces (blue squares) for all hostile fatalities (all coalition military fatalities attributed to insurgent activity). The green dashed line shows value b = 0.5, which is the situation in which there are no correlations. The subset of fatalities recorded in icasualties as "southern Afghanistan" is shown as a separate region because of their likely connection to operations near the Pakistan border

- b = scaling exponent(escalation rate)
- $\mathbb{R}$  Interevent time  $\tau_n$ between fatal attacks n-1 and n (binned by days)
- Learning curves organizations [37]
- More later on size distributions [9, 17, 6]

## Scaling laws for technology production:

"Statistical Basis for Predicting Technological Progress" Nagy et al., PLoS ONE, 2013. [31]

 $\gg y_t$  = stuff unit cost;  $x_t$  = total amount of stuff made.

Wright's Law, cost decreases as a power of total stuff made: [37]

$$y_t \propto x_t^{-w}$$
.

Moore's Law ☑, framed as cost decrease connected with doubling of transistor density every two years: [30]

$$y_t \propto e^{-m\,t}.$$

Sahal's observation that Moore's law gives rise to Wright's law if stuff production grows exponentially: [32]

$$x_t \propto e^{gt}$$
.

Sahal + Moore gives Wright with w = m/g.

Selected networks Electronic circuits	Component	373	2.12	0.747	0.602	0.05/4e-5	Power law	2.29	0.92	2		
Legos™	Piece	391	2.65	0.903	0.732	0.09/1e-7	Power law	1.41		3		
Businesses												
military vessels	Employee	13	1.88	0.971	0.832	0.05/3e-3	Power law	1.60		4		
military offices	Employee	8	1.59	0.964	0.789	0.16/0.16	Increasing	1.13	-	4		
universities	Employee	9	1.55	0.786	0.749	0.27/0.27	Increasing	1.37		4		
insurance co.	Employee	52	2.30	0.748	0.685	0.11/0.10	Increasing	3.04		4		
Universities												
across schools	Faculty	112	2.72	0.695	0.549	0.09/0.01	Power law	1.81	100 - No. 100 - 10	5		
history of Duke	Faculty	46	0.94	0.921	0.892	0.09/0.05	Increasing	2.07		5		
Ant colonies												
caste = type	Ant	46	6.00	0.481	0.454	0.11/0.04	Power law	8.16	10-11-12-12-12-12-12-12-12-12-12-12-12-12-	6		
size range = type	Ant	22	5.24	0.658	0.548	0.17/0.04	Power law	8.00	- T	6		
Organisms	Cell	134	12.40	0.249	0.165	0.08/0.02	Power law	17.73		7		
Neocortex	Neuron	10	0.85	0.520	0.584	0.16/0.16	Increasing	4.56		9		
Competitive networks Biotas	Organism						Power law	≈3	0.3 to 1.0			
Cities	Business	82	2.44	0.985	0.832	0.08/8e-8	Power law	1.56		10		

<sup>\*(1)</sup> The kind of network, (2) what the nodes are within that kind of network, (3) the number of data points, (4) the logarithmic range of network sizes N (i.e. log(N<sub>max</sub> / N<sub>mix</sub>)), (5) the log-log correlation, (6) the semi-log correlation, (7) the serial-dependence probabilities under, respectively, power-law and logarithmic models, (8) the empirically determined best-fit relationship between differentiation C and organization size N (if one of the two models can be refuted with p < 0.05; otherwise we just write "increasing" to denote that neither model can be rejected), (9) the combinatorial degree (i.e. the inverse of the best-fit slope of a log-log plot of C versus N), (10) the scaling exponent for how quickly the edge-degree δ scales with type-network size C (in those places for which data exist), (11) figure in this text where the plots are presented. Values for biotas represent the broad trend from the literature.

#### Shell of the nut:

Scaling is a fundamental feature of complex systems.

Basic distinction between isometric and allometric scaling.

🙈 Powerful envelope-based approach: Dimensional analysis.

"Oh yeah, well that's just dimensional analysis" said the [insert your own adjective] physicist.

Tricksiness: A wide variety of mechanisms give rise to scalings, both normal and unusual.
