FIG. 2—A ideal diagrammatic summary of the development of a drainage system given for purposes of comparison only. The first four parts show extension, that is, initiation, a, integration, b, extension, and a, maximum extension. Parts 5 and 6 represent slope during integration.

The sequential stages recognized in the evolution of a drainage system are “extension” and “integration”; the first, a stage of increasing complexity; the second, of simplification.

## Geomorphological networks

### Definitions

- Drainage basin** for a point  $p$  is the complete region of land from which overland flow drains through  $p$ .
- Definition most sensible for a point in a stream.
- Recursive structure**: Basins contain basins and so on.
- In principle, a drainage basin is defined at every point on a landscape.
- On flat hillslopes, drainage basins are effectively linear.
- We treat subsurface and surface flow as following the gradient of the surface.
- Okay for large-scale networks ...

## Introduction

### Branching networks are useful things:

- Fundamental to material **supply and collection**
- Supply**: From one source to many sinks in 2- or 3-d.
- Collection**: From many sources to one sink in 2- or 3-d.
- Typically observe hierarchical, recursive self-similar structure

### Examples:

- River networks (our focus)
- Cardiovascular networks
- Plants
- Evolutionary trees
- Organizations (only in theory ...)

## Basic basin quantities: $a, l, L_{||}, L_{\perp}$ :

- $a$  = drainage basin area
- $l$  = length of longest (main) stream (which may be fractal)
- $L = L_{||}$  = longitudinal length of basin
- $L = L_{\perp}$  = width of basin

# Allometry

**Isometry:**  
dimensions scale linearly with each other.

**Allometry:**  
dimensions scale nonlinearly.

# There are a few more 'laws': [1]

Relation:	Name or description:
$T_k = T_1 (R_T)^{k-1}$ $\ell \sim L^d$	Tokunaga's law self-affinity of single channels
$n_\omega / n_{\omega+1} = R_n$ $\ell_{\omega+1} / \ell_\omega = R_\ell$	Horton's law of stream numbers Horton's law of main stream lengths
$\bar{a}_{\omega+1} / \bar{a}_\omega = R_a$ $\bar{s}_{\omega+1} / \bar{s}_\omega = R_s$	Horton's law of basin areas Horton's law of stream segment lengths
$L_\perp \sim L^H$	scaling of basin widths
$P(a) \sim a^{-\tau}$ $P(\ell) \sim \ell^{-\gamma}$	probability of basin areas probability of stream lengths
$\ell \sim a^h$	Hack's law
$a \sim L^D$	scaling of basin areas
$\Lambda \sim a^\beta$	Langbein's law
$\lambda \sim L^\varphi$	variation of Langbein's law

# Stream Ordering:

## Method for describing network architecture:

- Introduced by Horton (1945) [4]
- Modified by Strahler (1957) [7]
- Term: Horton-Strahler Stream Ordering [5]
- Can be seen as **iterative trimming** of a network.

# Basin allometry

## Allometric relationships:

- $\ell \propto a^h$
- $\ell \propto L^d$
- Combine above:  
 $a \propto L^{d/h} \equiv L^D$

# Reported parameter values: [1]

Parameter:	Real networks:
$R_n$	3.0–5.0
$R_a$	3.0–6.0
$R_\ell = R_T$	1.5–3.0
$T_1$	1.0–1.5
$d$	$1.1 \pm 0.01$
$D$	$1.8 \pm 0.1$
$h$	0.50–0.70
$\tau$	$1.43 \pm 0.05$
$\gamma$	$1.8 \pm 0.1$
$H$	0.75–0.80
$\beta$	0.50–0.70
$\varphi$	$1.05 \pm 0.05$

# Stream Ordering:

## Some definitions:

- A **channel head** is a point in landscape where flow becomes focused enough to form a stream.
- A **source stream** is defined as the stream that reaches from a channel head to a junction with another stream.
- Roughly analogous to capillary vessels.
- Use symbol  $\omega = 1, 2, 3, \dots$  for stream order.

# 'Laws'

Hack's law (1957) [3]:

$$\ell \propto a^h$$

reportedly  $0.5 < h < 0.7$

Scaling of main stream length with basin size:

$$\ell \propto L^d$$

reportedly  $1.0 < d < 1.1$

Basin allometry:

$$L_\parallel \propto a^{h/d} \equiv a^{1/D}$$

$D < 2 \rightarrow$  basins elongate.

# Kind of a mess ...

## Order of business:

- Find out how these relationships are connected.
- Determine most fundamental description.
- Explain origins of these parameter values

For (3): **Many attempts: not yet sorted out ...**

# Stream Ordering:

- Label all **source streams** as **order  $\omega = 1$**  and remove.
- Label all **new** source streams as **order  $\omega = 2$**  and remove.
- Repeat until one stream is left (order =  $\Omega$ )
- Basin is said to be of the order of the last stream removed.
- Example above is a basin of order  $\Omega = 3$ .

# Stream Ordering—A large example:

# Stream Ordering:

## Resultant definitions:

- A basin of order  $\Omega$  has  $n_\omega$  streams (or sub-basins) of order  $\omega$ .
  - $n_\omega > n_{\omega+1}$
- An order  $\omega$  basin has **area**  $a_\omega$ .
- An order  $\omega$  basin has a **main stream length**  $l_\omega$ .
- An order  $\omega$  basin has a **stream segment length**  $s_\omega$ 
  - an order  $\omega$  stream segment is only that part of the stream which is actually of order  $\omega$
  - an order  $\omega$  stream segment runs from the basin outlet up to the junction of two order  $\omega - 1$  streams

# Stream Ordering:

## Another way to define ordering:

- As before, label all **source streams** as **order  $\omega = 1$** .
- Follow all labelled streams downstream
- Whenever two streams of the same order ( $\omega$ ) meet, the resulting stream has order incremented by 1 ( $\omega + 1$ ).

- If streams of different orders  $\omega_1$  and  $\omega_2$  meet, then the resultant stream has order equal to the largest of the two.

## Simple rule:

$$\omega_3 = \max(\omega_1, \omega_2) + \delta_{\omega_1, \omega_2}$$

where  $\delta$  is the Kronecker delta.

# Horton's laws

## Self-similarity of river networks

- First quantified by Horton (1945)<sup>[4]</sup>, expanded by Schumm (1956)<sup>[6]</sup>

## Three laws:

- Horton's law of stream numbers:

$$n_\omega / n_{\omega+1} = R_n > 1$$

- Horton's law of stream lengths:

$$\bar{l}_{\omega+1} / \bar{l}_\omega = R_l > 1$$

- Horton's law of basin areas:

$$\bar{a}_{\omega+1} / \bar{a}_\omega = R_a > 1$$

# Stream Ordering:

## One problem:

- Resolution of data messes with ordering
- Micro-description changes (e.g., order of a basin may increase)
- ...but relationships based on ordering appear to be robust to resolution changes.

## Utility:

- Stream ordering helpfully discretizes a network.
- Goal: understand **network architecture**

# Horton's laws

## Horton's Ratios:

- So ...laws are defined by three ratios:

$$R_n, R_l, \text{ and } R_a.$$

- Horton's laws describe **exponential decay or growth**:

$$\begin{aligned} n_\omega &= n_{\omega-1} / R_n \\ &= n_{\omega-2} / R_n^2 \\ &\vdots \\ &= n_1 / R_n^{\omega-1} \\ &= n_1 e^{-(\omega-1) \ln R_n} \end{aligned}$$

# Horton's laws

Similar story for area and length:

$$\bar{a}_\omega = \bar{a}_1 e^{(\omega-1)\ln R_a}$$

$$\bar{\ell}_\omega = \bar{\ell}_1 e^{(\omega-1)\ln R_\ell}$$

- As stream order increases, **number drops** and **area and length increase**.

# Horton's laws

Observations:

- Horton's ratios vary:

$R_n$	3.0-5.0
$R_a$	3.0-6.0
$R_\ell$	1.5-3.0

- No accepted explanation for these values.
- Horton's laws tell us how quantities vary from level to level ...
- ...but they don't explain how networks are structured.

# Horton's laws

A few more things:

- Horton's laws are laws of averages.
- Averaging for number is **across** basins.
- Averaging for stream lengths and areas is **within** basins.
- Horton's ratios go a long way to defining a branching network ...
- But we need one other piece of information ...

# Tokunaga's law

Delving deeper into network architecture:

- Tokunaga (1968) identified a clearer picture of network structure [8, 9, 10]
- As per Horton-Strahler, use **stream ordering**.
- Focus:** describe how streams of different orders connect to each other.
- Tokunaga's law is also a law of averages.

# Network Architecture

Definition:

- $T_{\mu,\nu}$  = the average number of **side streams of order  $\nu$**  that enter as tributaries to streams of **order  $\mu$**
- $\mu, \nu = 1, 2, 3, \dots$
- $\mu \geq \nu + 1$
- Recall each stream segment of order  $\mu$  is 'generated' by two streams of order  $\mu - 1$
- These generating streams are not considered side streams.

# Network Architecture

Tokunaga's law [8, 9, 10]

Property 1: Scale independence—depends only on difference between orders:

$$T_{\mu,\nu} = T_{\mu-\nu}$$

Property 2: Number of side streams grows exponentially with difference in orders:

$$T_{\mu,\nu} = T_1 (R_T)^{\mu-\nu-1}$$

We usually write Tokunaga's law as:

$$T_k = T_1 (R_T)^{k-1} \text{ where } R_T \approx 2$$

## Tokunaga's law—an example:

$$T_1 \approx 2$$

$$R_T \approx 4$$

## Nutshell:

- Branching networks show remarkable **self-similarity** over many scales.
- There are many interrelated scaling laws.
- Horton-Strahler **Stream ordering** gives one useful way of getting at the architecture of branching networks.
- Horton's laws** reveal self-similarity.
- Horton's laws can be misinterpreted as suggesting a pure hierarchy.
- Tokunaga's laws** neatly describe network architecture.
- Branching networks exhibit a mixed hierarchical structure.
- Horton and Tokunaga can be connected analytically.
- Surprisingly:

$$R_n = \frac{(2 + R_T + T_1) + \sqrt{(2 + R_T + T_1)^2 - 8R_T}}{2}$$
