Baby names, much studied: [23]

HOW TO: ABSURD SCIENTIFIC ADVICE FOR COMMON REAL-WORLD PROBLEMS

just a decade or so. If you were born in the United States around this year, these are names that are more likely to seem common and generic to you, but are distinctive generational markers.

1800 WW, Maude, Minnie, May, Cora, Ida, Lula, Hattie, Jennie, Ada 1885 Grover, Maude, Will, Minnie, Lizzie, Effie, May, Cora, Lula, Nettie 1890 Maude, May, Minnie, Effe, Mabel, Bessie, Nettie, Hattie, Lula, Cora 1895 Maude, Mabel, Minnie, Bessie, Manie, Murtle, Hattie, Pearl, Ethel, Bertha 1900 Mabel, Murtle, Bessie, Marnie, Poarl, Blanche, Gertrade, Ethel, Minnie, Gladus 1905 Gladus, Viola, Mabel, Murtle, Gertrade, Poarl, Bessie, Blanche, Marnie, Ether 1910 Theims, Gladus, Viola, Mildred, Beatrice, Lucille, Gertrade, Aanes, Hazel, Ethel 1915 Mildred Lucille, Theime, Helen, Bernice, Pauline, Eleanor, Beatrice, Ruth, Dorothy, 1920 Mariarie, Darathy, Mildred, Lucille, Warren, Thelma, Bernice, Virainia, Helen, June 1925 Daris June, Betta, Mariorie, Dorothy, Lorraine, Lais, Norme, Virginia, Juanite 1900 Dalares, Betta, Joan, Billie, Daris, Norma, Loie, Billo, Aure, Marihur 1935 Shiriya Marlene Jaan Dalares Marilan Bahbu Betta Billy Jones Browth 1940 Carole, Judith, Judy, Carol, Jopce, Barbara, Joan, Carolyn, Shirley, Jerry 1945 Judy, Judith, Linda, Carol, Sharon, Sandra, Carolyn, Larry, Janice, Dennis 1960 Linda, Deborah, Gail, Audy, Gary, Larry, Diane, Dennis, Brenda, Janice 1965 Debra, Deborah, Cathy, Kathy, Pamela, Randy, Kim, Canthia, Diane, Chergl 1960 Debbie, Kim, Terri, Cindy, Kathy, Cathy, Laurie, Lori, Debro, Ricky 1965 Lise, Tanny, Lori, Todd, Kim, Rhonda, Tracy, Tina, Dawn, Michele 1970 Tammy, Tonya, Tracy, Todd, Dawn, Tine, Stacey, Stacy, Michele, Lisa 1975 Chad, Jason, Tonya, Heather, Jennifer, Amy, Stacy, Shannon, Stacey, Teru 1980 Brandy, Crystal, April, Jason, Jerviny, Erin, Tiffany, Jamie, Meliosa, Jennif 1905 Krystel, Lindsey, Ashley, Lindsey, Dustin, Jessica, Amanda, Tiffany, Crystal, Amber 1990 Brittony, Chelsen, Kelsen, Cody, Ashley, Courtney, Kayla, Kule, Meann, Jessica 1995 Taulor, Keiseu, Dokoto, Austin, Haleu, Codu, Tuler, Sheibu, Brittany, Kayle 2000 Destinu, Madison, Haley, Sudney, Alexis, Kaitlyn, Hunter, Brianna, Hannah, Alussa 2005 Aidan, Dicoo, Gavin, Halley, Ethan, Madison, Ava, Isabella, Jauden, Aiden 2010 Jayden, Aiden, Nevaek, Addison, Branden, Landon, Peaton, Isabella, Ang, Liam 2015 Aria, Herper, Scarlett, Jacon, Granson, Lincoln, Hudson, Liam, Zory, Laula

If kids in your class were named Jeff, Lisa, Michael, Karen, and David, then you were probably born in the mid-1960s. If they were named Jayden, Isabella, Sophia, Ava, and Ethan, then you were probably born somewhere around 2010.

But names can reveal things about age in other ways.

The mid-1990s TV show Priends featured six roommates, played by actors, named Matthew, Jennifer, Courtney, Lisa, David, and another Matthew. Each of those names has its own popularity curve; if we combine them all, we can guess what years the group of actors was likely born:

Page 234 of 308

The actors were actually bern in the late 1960s, on the very early edge of the popularity of their mems. In other works, the actors all have names that were a little to before their time. Countrapy Cox and Jennifer Aniston had names that didn't really become popular unit al decade later. (Maybe porple) with trendy parents are more likely to wind up in acting.) But the names are generally consistent with their era, if a little aband of the curves.

We get something very different if we look at the names of their *characters*-Phoebe, Joseph, Ross, Chandler, Rachel, and Monica:

1965 1970 1975 1980 1985 1990 1995 2000 2005 2010 2015

The show debuted in 1949. There's a clear spike in popularity of the names in 1995 and 1996, which can probably be attributed to the show putting the names in the minds of new parents. But it's not just the show—that name combination was clearly on the rise in the years before 7 rinned premiend. It's possible that parents looking for good names for their children are influenced by some of the same cultural trends as IT writters looking for good names for their characters. How to build a dynamical dashboard that helps sort through a massive number of interconnected time series?

"Is language evolution grinding to a halt? The scaling of lexical turbulence in English fiction suggests it is not" Pechenick, Danforth, Dodds, Alshaabi, Adams, Dewhurst, Reagan, Danforth, Reagan, and Danforth. Journal of Computational Science, **21**, 24–37,

For language, Zipf's law has two scaling regimes: ^[34]

 $f \sim \begin{cases} r^{-\alpha} \text{ for } r \ll r_{\rm b}, \\ r^{-\alpha'} \text{ for } r \gg r_{\rm b}, \end{cases}$

When comparing two texts, define Lexical turbulence as flux of words across a frequency threshold:

$$\phi \sim \begin{cases} f_{\rm thr}^{-\mu} \text{ for } f_{\rm thr} \ll f_{\rm b}, \\ f_{\rm thr}^{-\mu'} \text{ for } f_{\rm thr} \gg f_{\rm b}, \end{cases}$$

Estimates: $\mu \simeq 0.77$ and $\mu' \simeq 1.10$, and $f_{\rm b}$ is the scaling break point.

$$\phi \sim \left\{ \begin{array}{l} r^{\nu} = r^{\alpha \mu'} \text{ for } r \ll r_{\rm b}, \\ r^{\nu'} = r^{\alpha' \mu} \text{ for } r \gg r_{\rm b}. \end{array} \right.$$

Estimates: Lower and upper exponents $\nu \simeq 1.23$ and $\nu' \simeq 1.47$.

(15)

where

$$\mathcal{N}_{1,2;\infty} = \sum_{\tau \in R_1} \frac{1}{r_{\tau,1}} + \sum_{\tau \in R_2} \frac{1}{r_{\tau,2}}.$$

🚓 Highest ranks dominate.

Probability-turbulence divergence:

$$D^{\mathsf{P}}_{\alpha}(P_1 \mid\mid P_2) = \frac{1}{\mathcal{N}^{\mathsf{P}}_{1,2;\alpha}} \frac{\alpha+1}{\alpha} \sum_{\tau \in R_{1,2;\alpha}} \left| \left[p_{\tau,1} \right]^{\alpha} - \left[p_{\tau,2} \right]^{\alpha} \right|^{1/(\alpha+1)}$$
(16)

So For the unnormalized version ($\mathcal{N}_{1,2;\alpha}^{\mathsf{P}}$ =1), some troubles return with 0 probabilities and $\alpha \to 0$. Weep not: $\mathcal{N}_{1,2;\alpha}^{\mathsf{P}}$ will save the day.

With no matching types, the probability of a type present in one system is zero in the other, and the sum can be split between the two systems' types:

$$\mathcal{N}_{1,2;\alpha}^{\mathsf{P}} = \frac{\alpha+1}{\alpha} \sum_{\tau \in R_1} \left[p_{\tau,1} \right]^{\alpha/(\alpha+1)} + \frac{\alpha+1}{\alpha} \sum_{\tau \in R_2} \left[p_{\tau,2} \right]^{\alpha/(\alpha+1)}$$

Type contribution ordering for the limit of α =0

- Solution In terms of contribution to the divergence score, all exclusive types supply a weight of $1/(N_1 + N_2)$. We can order them by preserving their ordering as $\alpha \rightarrow 0$, which amounts to ordering by descending probability in the system in which they appear.
- And while types that appear in both systems make no contribution to $D_0^{\mathsf{P}}(P_1 \parallel P_2)$, we can still order them according to the log ratio of their probabilities.
- The overall ordering of types by divergence contribution for α =0 is then: (1) exclusive types by descending probability and then (2) types appearing in both systems by descending log ratio.

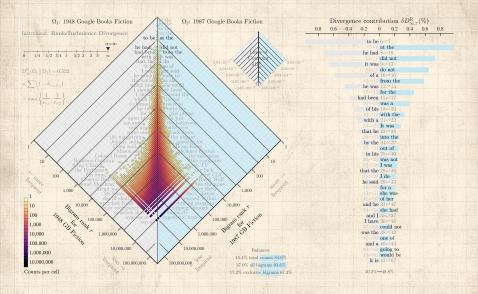

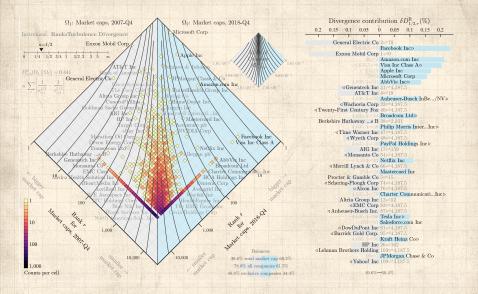

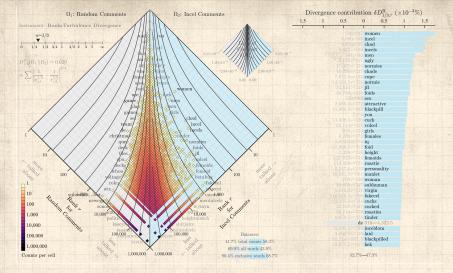

FIG. 8. Rank-turbulence divergence allotaxonograph [34] of word rank distributions in the incel vs random comment corpora. The rank-rank histogram on the left shows the density of words by their rank in the incel comments corpus against their rank in the random comments corpus. Words at the top of the diamond are higher frequency, or lower rank. For example, the word "the" appears at the highest observed frequency, and thus has the lowest rank, 1. This word has the lowest rank in both corpora, so its coordinates lie along the center vertical line in the plot. Words such as "women" diverge from the center line because their rank in the incel corpus is higher than in the random corpus. The top 40 words are more common in the incel corpus, so they point to the right. In this comparison, nearly all of the top 40 words are more common in the incel corpus, so they point to the right. The word that has the most notable change in rank from the random to incel corpus is "women", the object of hatred

Effect of subsampling:

"This is truly the last time, believe me"

The Washington Post

H years of Mark Zuckerberg saying sorry, not sorry

By Geoffrey A. Fowler and Chiqui Estaban April 9, 2019 Do you trust Mark Zuckerberg?

From the moment the Facebook founder entered the public eye in 2003 for creating a Harvard student hot-or-not rating site, he's been apologizing. So we collected this abbreviated history of his public mea culpus.

It reads like a record on repeat. Znokorberg, who made "move fast and break things" his slogan, says sorry for being naive, and then premises subhines such as privacy "controls," "transparency" and better policy "minorement." And then he premises it again the next time. You can track his <u>version tiorarys</u> and <u>premises its bars</u> in the timeline below.

All the while, Facebook's access to our personal data increases and little charges about the very Zackerberg handles it. So as Zackerberg prepares to apologize for the first time in front of Congress, the question that lingers ic: What will be different this time?

Robert Godwin S

"Our hearts go out to the family and friends of Robert Godwin Sr., and we have a lot of work – and we will keep doing all we can to prevent tragedies like this from happening."

September 2017 While revealing a nine-step plan to step nations from using Facebook to interfere in one another's elections, noting that the amount of "problematic content" found so far is "relatively small."

"I care deeply about the democratic process and protecting its integrity.... It is a new challenge for internet communities to deal with

WaPo article

After launching Beacon, which opted in everyone to sharing with advertisers what they were doing in outside websites and apps.

We simply did a bad job with this release and I apologize for it. ... People need to be able to explicitly choose what they share.

February 2009 After unveiling new terms of service that angered users.

"Over the past couple of days, we received a lot of questions and comments. ... Based on this feedback, we have decided to return to our previous terms of use while we resolve the issues."

* We won't prevent all mistakes or abuse, but we currently make too many errors our policies and preventing misuse of our tools. This will be ascrinas year of selfimprovement and I'm looking forward to learning from working to fix our issues together.

March 2018 After details emerged about Cambridge Analytica taking user data.

We have a responsibility to protect your data, and if we can't then we don't deserve to serve you.....We will learn from this experience to secure our platform further and make our community safer for everyone going forwart." Commission for deceiving consumers about privacy.

bunch of mistakes, ... Facebook has always been committed to being transparent about the information you have stored with us – and we have led the internet in building tools to give people the ability to see and control what they share.¹

Jaly 2014 After an academic paper exposed that Facebook conducted psychological tests on nearly 700,000 users without their knowledge. Wealeret Facebook Coo Stend Sandbert

It was my mistake, and I'm sorry. ... There's more we can do here to limit the information developers can access and put more safeguards in place to prevent abuse."

Understanding the Sociotechnocene—Stories:

stories.

Toward a Science of Stories.

- Claim: Homo narrativus C—we run on stories.
 - "What's the John Dory?"
- lost the plot/thread"
 - Narrative hierarchies and scalability of stories .

Research: Real-time and offline
 extraction of metaphors, frames,
 plots, narratives, conspiracy theories,
 and stories from large-scale text.
 Research: The taxonomy of human

To be built: Storyscopes—improvable, online, interactive instruments.
