## Definitions

### Complicated versus Complex:

- 🧩 Complicated: Mechanical watches, airplanes, ...
- 🧩 Engineered systems can be made to be **highly robust but not adaptable**.
- 🧩 But engineered systems can become complex (power grid, planes).
- 🧩 They can also **fail spectacularly**.
- 🧩 Explicit distinction: **Complex Adaptive Systems**.

## Definitions

### A working definition of a Complex System:

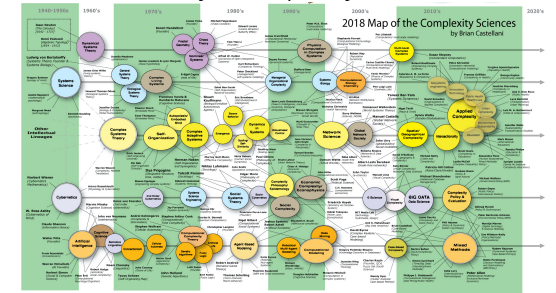

- 🧩 Distributed system of many interrelated (possibly networked) parts with no centralized control exhibiting emergent behavior—'More is Different'<sup>[1]</sup>

### Other features/aspects:

- 🧩 Explicit nonlinear relationships.
- 🧩 Presence of feedback loops.
- 🧩 Being open or driven, opaque boundaries.
- 🧩 Memory.
- 🧩 Modular (nested)/multiscale structure.
- 🧩 Mechanisms range from being purely physical to purely algorithmic in nature.

## Definitions

Complex: (Latin = with + fold/weave (com + plex)) 🌐

### Adjective:

- Made up of multiple parts; intricate or detailed.
- Not simple or straightforward.

## Examples of Complex Systems:

- 🧩 human societies
- 🧩 financial systems
- 🧩 cells
- 🧩 ant colonies
- 🧩 fluids, weather systems
- 🧩 ecosystems
- 🧩 power grids
- 🧩 animal societies
- 🧩 disease ecologies
- 🧩 brains
- 🧩 social insects
- 🧩 geophysical systems
- 🧩 forests
- 🧩 Internet + Web

## Cryptograph—What's being plotted here?:

# Fractional weight of typical human body by atomic species: [↗](#)

## We are a somewhat difficult LEGO™ set:

- ☿ Written on the box: “Nearly  $10^{27}$  of 29 kinds of pieces!”
- ☿ **Only in 2014** was bromine [shown](#) to be an essential trace element. <sup>[4]</sup>
- ☿ 6 elements make up  $\approx 99\%$  of the body's elements:  
Oxygen, carbon, hydrogen, nitrogen, calcium, and phosphorous.
- ☿ Next 5 elements make up  $\approx 0.85\%$ :  
Potassium, sulfur<sup>1</sup>, sodium, chlorine, and magnesium.
- ☿ Remaining 18 necessary elements are trace elements.
- ☿ Could be worse: A box with three packets containing up quarks, down quarks, and electrons.

<sup>1</sup>Naturally varies with evilness

## Ludwig Boltzmann [↗](#), 1844–1906. Atomic Theory.

“Boltzmann’s kinetic theory of gases seemed to presuppose the reality of atoms and molecules, but almost all German philosophers and many scientists like Ernst Mach and the physical chemist Wilhelm Ostwald disbelieved their existence.”

“In 1904 at a physics conference in St. Louis most physicists seemed to reject atoms and he was not even invited to the physics section. Rather, he was stuck in a section called “applied mathematics,” he violently attacked philosophy, especially on allegedly Darwinian grounds but actually in terms of Lamarck’s theory of the inheritance of acquired characteristics that people inherited bad philosophy from the past and that it was hard for scientists to overcome such inheritance.”

## Feynmann:

“If, in some cataclysm, all of scientific knowledge were to be destroyed, and only one sentence passed on to the next generation of creatures, what statement would contain the most information in the fewest words?”

“I believe it is the atomic hypothesis that all things are made of atoms—little particles that move around in perpetual motion, attracting each other when they are a little distance apart, but repelling upon being squeezed into one another. “In that one sentence, you will see, there is an enormous amount of information about the world, if just a little imagination and thinking are applied.”

## The Science of Complex Systems Manifesto: [↗](#)

1. Systems are ubiquitous and systems matter.
2. Consequently, much of science is about understanding how pieces dynamically fit together.
3. 1700 to 2000 = Golden Age of Reductionism: Atoms!, sub-atomic particles, DNA, genes, people, ...
4. Understanding and creating systems (including new ‘atoms’) is the greater part of science and engineering.
5. [Universality](#) [↗](#): systems with quantitatively different micro details exhibit qualitatively similar macro behavior (fate, but real and limited)
6. Computing advances make the Science of Complex Systems possible:
  - 6.1 We can measure and record enormous amounts of data, research areas continue to transition from data scarce to data rich.
  - 6.2 We can simulate, model, and create complex systems in extraordinary detail.
