Scalingarama

General observation:

Systems (complex or not) that cross many spatial and temporal scales often exhibit some form of scaling.

Outline—All about scaling:

Basic definitions.

Examples.

Possibly later:

Advances in measuring your power-law relationships.

Scaling in blood and river networks.

The Unsolved Allometry Theoricides.

Definitions

A power law relates two variables x and y as follows:

$$y = cx^{\alpha}$$

 $\ \ \alpha$ is the scaling exponent (or just exponent)

c is the prefactor (which can be important!)

The PoCSverse Scaling 9 of 125

Scaling-at-large

Allometry

Biology

Physics

People

Money

Language

Technology Specialization

Definitions

 \clubsuit The prefactor c must balance dimensions.

 \clubsuit Imagine the height ℓ and volume v of a family of shapes are related as:

$$\ell = cv^{1/4}$$

Using [-] to indicate dimension, then

$$[c] = [\ell]/[v^{1/4}] = L/L^{3/4} = L^{1/4}.$$

 \clubsuit More on this later with the Buckingham π theorem.

Looking at data

8

Power-law relationships are linear in log-log space:

$$y = cx^{\alpha}$$

$$\Rightarrow \log_b y = \alpha \log_b x + \log_b c$$

with slope equal to α , the scaling exponent.

- Much searching for straight lines on log-log or double-logarithmic plots.
- Good practice: Always, always, always use base 10.
- Yes, the Dozenalists

 are right, 12 would be better.
- & But: hands. 1 And social pressure.
- Talk only about orders of magnitude (powers of 10).

THE SCALES

¹Probably an accident of evolution—debated.

A beautiful, heart-warming example:

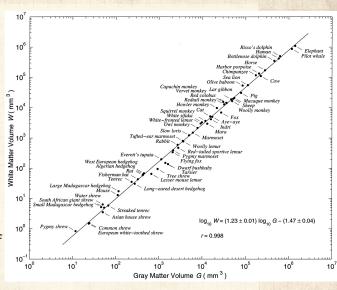

G = volume of gray matter:

'computing elements'

W = volume of white matter: 'wiring'

Why is $\alpha \simeq 1.23$?

Quantities (following Zhang and Sejnowski):

& G = Volume of gray matter (cortex/processors)

 $\Re W = \text{Volume of white matter (wiring)}$

Rrightarrow T = Cortical thickness (wiring)

& L= Average length of white matter fibers

p = density of axons on white matter/cortex interface

A rough understanding:

 $lap{le}{le} G \sim ST$ (convolutions are okay)

 $\Re W \sim \frac{1}{2}pSL$

 $\Re G \sim L^3$

 \Leftrightarrow Eliminate S and L to find $W \propto G^{4/3}/T$

The PoCSverse Scaling 13 of 125

Specialization

Why is $\alpha \simeq 1.23$?

A rough understanding:

 \clubsuit We are here: $W \propto G^{4/3}/T$

 \clubsuit Observe weak scaling $T \propto G^{0.10\pm0.02}$.

 \Longrightarrow Implies $S \propto G^{0.9} \rightarrow$ convolutions fill space.

 $\Longrightarrow W \propto G^{4/3}/T \propto G^{1.23\pm0.02}$

The PoCSverse Scaling 14 of 125

Language

Technology

Specialization

Good scaling:

General rules of thumb:

High quality: scaling persists over three or more orders of magnitude for each variable.

Medium quality: scaling persists over three or more orders of magnitude for only one variable and at least one for the other.

Very dubious: scaling 'persists' over less than an order of magnitude for both variables. The PoCSverse Scaling 17 of 125

Allometry:

Dimensions scale nonlinearly.

Allometry:

Definitions

Isometry versus Allometry:

& Iso-metry = 'same measure'

Allo-metry = 'other measure'

We use allometric scaling to refer to both:

- 1. Nonlinear scaling of a dependent variable on an independent one (e.g., $y \propto x^{1/3}$)
- 2. The relative scaling of correlated measures (e.g., white and gray matter).

Technology Specialization

The many scales of life:

The biggest living things (left). All the organisms are drawn to the same scale. 1, The largest flying bird (albatross); 2, the largest known animal (the blue whale), 3, the largest extinct land mammal (Baluchitherium) with a human figure shown for scale: 4, the tallest living land animal (giraffe); 5, Tvrannosaurus; 6, Diplodocus; 7, one of the largest flying reptiles (Pteranodon); 8, the largest extinct snake: 9, the length of the largest tapeworm found in man; 10, the largest living reptile (West African crocodile); 11, the largest extinct lizard; 12, the largest extinct bird (Aepyornis); 13, the largest jellyfish (Cyanea); 14, the largest living lizard (Komodo dragon); 15, sheep; 16, the largest bivalve mollusc (Tridacna); 17; the largest fish (whale shark); 18, horse; 19, the largest crustacean (Japanese spider crab); 20, the largest sea scorpion (Eurypterid); 21, large tarpon; 22, the largest lobster; 23, the largest mollusc (deep-water squid, Architeuthis); 24, ostrich; 25, the lower 105 feet of the largest organism (giant seguoia), with a 100-foot larch superposed.

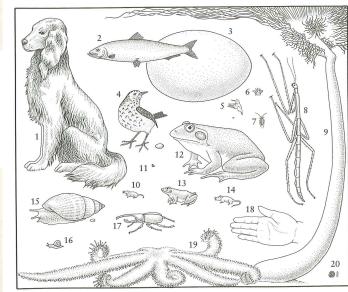

p. 2, McMahon and Bonner ^[26]

The many scales of life:

Medium-sized creatures (above). 1, Dog; 2, common herring; 3, the largest egg (Aepyornis); 4, song thrush with egg; 5, the smallest bird (hummingbird) with egg; 6, queen bee; 7, common cockroach; 8, the largest stick insect; 9, the largest polyp (Branchiocerianthus); 10, the smallest mammal (flying shrew); 11, the smallest vertebrate (a tropical frog); 12, the largest frog (goliath frog); 13, common grass frog; 14, house mouse; 15, the largest land snail (Achatina) with egg; 16, common snail; 17, the largest beetle (goliath beetle); 18, human hand; 19, the largest starfish (Luidia); 20, the largest free-moving protozoan (an extinct nummulite).

p. 3, McMahon and Bonner [26] More on the Elephant Bird here ...

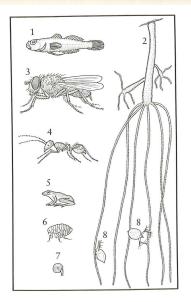

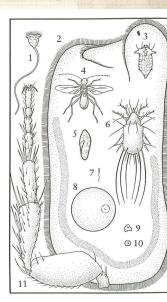

The many scales of life:

Small, "naked-eye" creatures (lower left).
1, One of the smallest fishes (Trimmatom nanus); 2, common brown hydra, expanded; 3, housefly; 4, medium-sized ant, 5, the smallest vertebrate (a tropical frog, the same as the one numbered 11 in the figure above); 6, flea (Xenopsylla cheopis); 7, the smallest land snail; 8, common water flea (Daphnia).

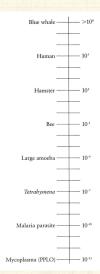

The smallest "naked-eye" creatures and some large microscopic aimais and cells (below right). 1, Vorticella, a cliate; 2, the largest cliate protocoan (Bursaria); 3, the smallest thrany-celled animal (a rotifer); 4, smallest thying usest (Lighphis); 5, another cliate (branecium); 6, cheese mite; 7, human sperm, 5, human sperm, 60; 17, the foreleg of the flea (numbered 6 in the figure to the left).

From How do wombats poop cubes? Scientists get to the bottom of the mystery , Science, 2021/01/27:

That just leaves one mystery: why wombats evolved cubic poop in the first place.

Hu speculates that because the animals climb up on rocks and logs to mark their territory, the flat-sided feces aren't as likely to roll off from these high perches.

In the meantime, Hu also thinks this knowledge could help researchers raising wombats in captivity.

"Sometimes their feces aren't as cubic as the [wild] ones," he says.

The squarer the poop, the healthier the wombat.'

Non-simple scaling for death:

"Statistical signs of social influence on suicides"

Melo et al., Scientific Reports, 4, 6239, 2014. [27]

- A Homicide, traffic, and suicide [10] all tied to social context in complex, different ways.
- For cities in Brazil, Melo et al. show:
 - Homicide appears to follow superlinear scaling $(\beta = 1.24 + 0.01)$
 - Traffic accident deaths appear to follow linear scaling ($\beta = 0.99 \pm 0.02$)
 - Suicide appears to follow sublinear scaling. $(\beta = 0.84 \pm 0.02)$

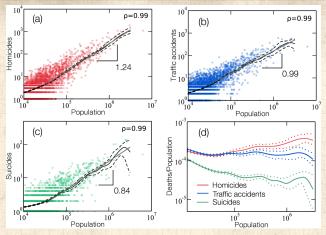

Figure 1 | Scaling relations for homicides, traffic accidents, and suicides for the year of 2009 in Brazil. The small circles show the total number of deaths by (a) homicides (red), (b) traffic accidents (blue), and (c) suicides (green) vs the population of each city. Each graph represents only one urban indicator, and the solid gray line indicate the best fit for a power-law relation, using OLS regression, between the average total number of deaths and the city size (population). To reduce the fluctuations we also performed a Nadaraya-Watson kernel regression^{17,18}. The dashed lines show the 95% confidence band for the Nadaraya-Watson kernel regression applied to the data on homicides in (a) reveals an allometric exponent $\beta = 1.24 \pm 0.01$, with a 95% confidence interval estimated by bootstrap. This is compatible with previous results obtained for U.S.² that also indicate a super-linear scaling relation with population and an exponent $\beta = 1.16$. Using the same procedure, we find $\beta = 0.99 \pm 0.02$ and 0.84 ± 0.02 for the numbers of deaths in traffic accidents (b) and suicides (c), respectively. The values of the Pearson correlation coefficients ρ associated with these scaling relations are shown in each plot. This non-linear behavior observed for homicides and suicides certainly reflects the complexity of human social relations and strongly suggests that the the topology of the social network plays an important role on the rate of these events. (d) The solid lines show the Nadaraya-Watson kernel regression rate of deaths (total number of deaths divided by the population of a city) for each urban indicator, namely, homicides (red), traffic accidents (blue), and suicides (green). The dashed lines represent the 95% confidence bands. While the rate of fatal traffic accidents remains approximately invariant, the rate of homicides systematically increases, and the rate of suicides decreases with population.

Dynamics (Brazil):

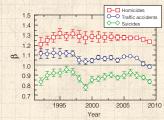

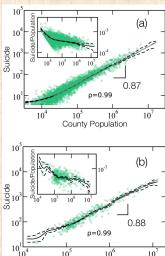

Figure 2 | Temporal evolution of allometric exponent β for homicides (red squares), deaths in traffic accidents (blue circles), and suicides (green diamonds). Time evolution of the power-law exponent β for each behavioral urban indicator in Brazil from 1992 to 2009. We can see that the non-linear behavior for homicides and suicides are robust for this 19 years period, and for the traffic accidents the exconent remain close to 1.0.

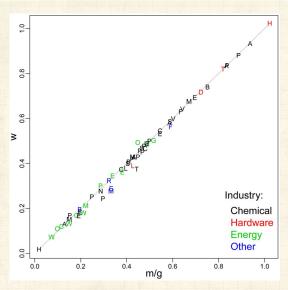

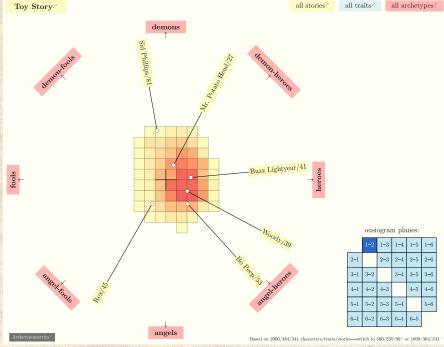

Figure 4. An illustration that the combination of exponentially increasing production and exponentially decreasing cost are equivalent to Wright's law. The value of the Wright parameter w is plotted against the prediction m/g based on the Sahal formula, where m is the exponent of cost reduction and g the exponent of the increase in cumulative production. doi:10.1371/journal.pone.0052669.g004

When the group moved to California to become part of Lucasfilm, we got close to making a computer-animated movie again in the mid-1980s – this time about a monkey with godlike powers but a missing prefrontal cortex. We had a sponsor, a story treatment, and a marketing survey. We were prepared to make a screen test: Our hot young animator John Lasseter had sketched numerous studies of the hero monkey and had the sponsor salivating over a glass-dragon protagonist.'

"But when it came time to harden the deal and run the numbers for the contracts, I discovered to my dismay that computers were still too slow: The projected production cost was too high and the computation time way too long. We had to back out of the deal. This time, we did know enough detail to correctly apply Moore's Law – and it told us that we had to wait another five years to start making the first movie. And sure enough, five years later Disney approached us to make Toy Story."

'We implement each step to see if it actually works, then gain the courage, the insight, and the engineering mastery to proceed to the next step.

Moore's Law told us that the new company we were starting, Pixar, had to bide its time—building hardware instead of making movies.'

Rhetoric of maybeness with hook to "More is different"

'That's the reason for expressing Moore's Law in orders of magnitude rather than factors of 10. The latter form is merely arithmetic, but the former implies an intellectual challenge. We use "order of magnitude" to imply a change so great that it requires new thought processes, new conceptualizations: It's not simply more, it's different.'

A key framing from language:

Types and Tokens:

- In linguistics, words are described on the two levels of types and tokens [32].
- In semiotics, signs can be thought of having two components of the signified and the signifier .

Example:

- Types are 1-grams ☑, e.g., '!', 'the', 'love', and 'spork'.
- Tokens are 1-grams as written down.
- In "Pride and Prejudice", for example, there are 498 '!'s, 4,058 'the's, 90 'love's, and 0 'spork's.

Beyond language:

Lift out and expand the type-token framing to complex systems in general.

Three Four possible parts:

- 1. Type: A kind or class of category of individual things based on shared characteristics.
- 2. Thing: An individual manifestation of a type.
- 3. Measure: A quantification of the manifestation of things.
- 4. Experience: An interaction of any kind with a manifestation of a type.⁸

Language:

- 1. Type: A defined word.
- 2. Thing (token): An instance of spoken or printed word.
- 3. Number or Frequency (counts of tokens).
- 4. Experience: Listening to others, reading a book.

Atoms:

- 1. Type: Atom
- 2. Thing: Element (stuff made of a given atom; e.g., gold)
- 3. Measure: Mass; could be Number.
- 4. Experience: Atomic bonds.

Allometry

Biology

Physics

People

Money

Language Technology

тестпогоду

Specialization

Water:

- 1. Type: Water molecule, H²O.
- 2. Thing: Water.
- 3. Measure: Volume (liters, gallons); given pressure and temperature, equivalent to Number (counts of molecules) and then Mass.
- 4. Experience: Rain.

Biology:

- Example type: The species Ornithorhynchus anatinus, the platypus.
- Thing: Any given platypus.
- Measure: The number of platypuses ('instances' of the species) living in Australia in the wild.
- Experience: Seeing a platypus in the wild; being hunted by a platypus.

Moneyspace:

Example type: Corporation.

Things: The publicly traded companies of Apple and Microsoft.

🙈 Measure: Market capitalization.

Experience: Being sued by Microsoft.

Apple and Microsoft may be viewed as components of the publicly-owned corporate world.

The sizes of corporations may be broken down into many rankable dimensions such as annual revenue or number of employees worldwide.

In principle, market capitalization represents a kind of current collective belief in terms of money. The PoCSverse Scaling 108 of 125

Sizes and Rankings:

- We will often consider systems where each component type τ has at least one measurable—and hence rankable—'size' s_{τ} .
- Perceived size is a combination of Measure (what exists) and Experience (what is measured).
- Important: We may also have rankings where we do not know the underlying 'size' (e.g., book/thing sales on Amazon).

The PoCSverse Scaling 109 of 125

Scaling-at-large Allometry

Biology

People Money

Language

Technology

Specialization

Three examples which show some of the range of what 'size' can mean:

- Size for a word in a corpus means the number of indistinguishable instances of that word (many identical entites—tokens);
- 2. Size for species means the number of 'biological replications' of an individual type (many genetically similar entities of varying ages); and
- 3. Size for a corporation might mean monetary value (market cap, one entity).
- 4. May have more than one measure of a system:
 - Total biomass of a species.9
 - Number of employees in a corporation.
 - Number of stars in a galaxy.9
- 5. Measure of size allows for rankings.
- 6. Again, sizes may be hidden.

⁹Somewhat hard to estimate.

When tokens are fungible:

Randomly permute all of the words (tokens) of the same type in Pride and Prejudice.

Measure and Experience will be unchanged.

NFTs: Non-fungible tokens.

Tricking people into thinking tokens are types.

"The Oxymoron for Morons."

When tokens are funguses:

NFF: Non-fungible fungus (from a sentient fungus's point of view).

But in cooking, funguses are fungible.

Lack of exposure leads to fungibility of "the other."10
