Random networks

How to build standard random networks:

- 🧱 Given N and m .
- 🧱 Two probabilistic methods (we'll see a third later on)
 1. Connect each of the $\binom{N}{2}$ pairs with appropriate probability p .
 - 🧱 Useful for theoretical work.
 2. Take N nodes and add exactly m links by selecting edges without replacement.
 - 🧱 **Algorithm:** Randomly choose a pair of nodes i and j , $i \neq j$, and connect if unconnected; repeat until all m edges are allocated.

Random networks

How to build standard random networks:

- 🧱 Given N and m .
- 🧱 Two probabilistic methods (we'll see a third later on)
 1. Connect each of the $\binom{N}{2}$ pairs with appropriate probability p .
 - 🧱 **Useful for theoretical work.**
 2. Take N nodes and add exactly m links by selecting edges without replacement.
 - 🧱 **Algorithm:** Randomly choose a pair of nodes i and j , $i \neq j$, and connect if unconnected; repeat until all m edges are allocated.
 - 🧱 Best for adding relatively small numbers of links (most cases).

Random networks

How to build standard random networks:

- 🧱 Given N and m .
- 🧱 Two probabilistic methods (we'll see a third later on)
 1. Connect each of the $\binom{N}{2}$ pairs with appropriate probability p .
 - 🧱 Useful for theoretical work.
 2. Take N nodes and add exactly m links by selecting edges without replacement.
 - 🧱 **Algorithm:** Randomly choose a pair of nodes i and j , $i \neq j$, and connect if unconnected; repeat until all m edges are allocated.
 - 🧱 Best for adding relatively small numbers of links (most cases).
 - 🧱 1 and 2 are effectively equivalent for large N .

Random networks

A few more things:

 For method 1, # links is probabilistic:

$$\langle m \rangle = p \binom{N}{2}$$

Limiting form of $P(k; p, N)$:

Our degree distribution:

$$P(k; p, N) = \binom{N-1}{k} p^k (1-p)^{N-1-k}.$$

What happens as $N \rightarrow \infty$?

We must end up with the normal distribution right?

Limiting form of $P(k; p, N)$:

Our degree distribution:

$$P(k; p, N) = \binom{N-1}{k} p^k (1-p)^{N-1-k}.$$

What happens as $N \rightarrow \infty$?

We must end up with the normal distribution right?

If p is fixed, then we would end up with a Gaussian with average degree $\langle k \rangle \simeq pN \rightarrow \infty$.

Limiting form of $P(k; p, N)$:

Our degree distribution:

$$P(k; p, N) = \binom{N-1}{k} p^k (1-p)^{N-1-k}.$$

What happens as $N \rightarrow \infty$?

We must end up with the normal distribution right?

If p is fixed, then we would end up with a Gaussian with average degree $\langle k \rangle \simeq pN \rightarrow \infty$.

But we want to keep $\langle k \rangle$ fixed...

Limiting form of $P(k; p, N)$:

Our degree distribution:

$$P(k; p, N) = \binom{N-1}{k} p^k (1-p)^{N-1-k}.$$

What happens as $N \rightarrow \infty$?

We must end up with the normal distribution right?

If p is fixed, then we would end up with a Gaussian with average degree $\langle k \rangle \simeq pN \rightarrow \infty$.

But we want to keep $\langle k \rangle$ fixed...

So examine limit of $P(k; p, N)$ when $p \rightarrow 0$ and $N \rightarrow \infty$ with $\langle k \rangle = p(N-1) = \text{constant}$.

$$P(k; p, N) \simeq \frac{\langle k \rangle^k}{k!} \left(1 - \frac{\langle k \rangle}{N-1} \right)^{N-1-k} \rightarrow \frac{\langle k \rangle^k}{k!} e^{-\langle k \rangle}$$

Limiting form of $P(k; p, N)$:

Our degree distribution:

$$P(k; p, N) = \binom{N-1}{k} p^k (1-p)^{N-1-k}.$$

What happens as $N \rightarrow \infty$?

We must end up with the normal distribution right?

If p is fixed, then we would end up with a Gaussian with average degree $\langle k \rangle \simeq pN \rightarrow \infty$.

But we want to keep $\langle k \rangle$ fixed...

So examine limit of $P(k; p, N)$ when $p \rightarrow 0$ and $N \rightarrow \infty$ with $\langle k \rangle = p(N-1) = \text{constant}$.

$$P(k; p, N) \simeq \frac{\langle k \rangle^k}{k!} \left(1 - \frac{\langle k \rangle}{N-1} \right)^{N-1-k} \rightarrow \frac{\langle k \rangle^k}{k!} e^{-\langle k \rangle}$$

This is a Poisson distribution  with mean $\langle k \rangle$.

Poisson basics:

$$P(k; \lambda) = \frac{\lambda^k}{k!} e^{-\lambda}$$

$\lambda > 0$

$k = 0, 1, 2, 3, \dots$

Classic use: probability that an event occurs k times in a given time period, given an average rate of occurrence.

e.g.:
phone calls/minute,
horse-kick deaths.

'Law of small numbers'

Poisson basics:

Normalization: we must have

$$\sum_{k=0}^{\infty} P(k; \langle k \rangle) = 1$$

Poisson basics:

 The **variance** of degree distributions for random networks turns out to be **very important**.

 Using calculation similar to one for finding $\langle k \rangle$ we find the **second moment** to be:

$$\langle k^2 \rangle = \langle k \rangle^2 + \langle k \rangle.$$

Poisson basics:

🧱 The **variance** of degree distributions for random networks turns out to be **very important**.

🧱 Using calculation similar to one for finding $\langle k \rangle$ we find the **second moment** to be:

$$\langle k^2 \rangle = \langle k \rangle^2 + \langle k \rangle.$$

🧱 Variance is then

$$\sigma^2 = \langle k^2 \rangle - \langle k \rangle^2$$

Poisson basics:

🧱 The **variance** of degree distributions for random networks turns out to be **very important**.

🧱 Using calculation similar to one for finding $\langle k \rangle$ we find the **second moment** to be:

$$\langle k^2 \rangle = \langle k \rangle^2 + \langle k \rangle.$$

🧱 Variance is then

$$\sigma^2 = \langle k^2 \rangle - \langle k \rangle^2 = \langle k \rangle^2 + \langle k \rangle - \langle k \rangle^2$$

Poisson basics:

🧱 The **variance** of degree distributions for random networks turns out to be **very important**.

🧱 Using calculation similar to one for finding $\langle k \rangle$ we find the **second moment** to be:

$$\langle k^2 \rangle = \langle k \rangle^2 + \langle k \rangle.$$

🧱 Variance is then

$$\sigma^2 = \langle k^2 \rangle - \langle k \rangle^2 = \langle k \rangle^2 + \langle k \rangle - \langle k \rangle^2 = \langle k \rangle.$$

Poisson basics:

🧱 The **variance** of degree distributions for random networks turns out to be **very important**.

🧱 Using calculation similar to one for finding $\langle k \rangle$ we find the **second moment** to be:

$$\langle k^2 \rangle = \langle k \rangle^2 + \langle k \rangle.$$

🧱 Variance is then

$$\sigma^2 = \langle k^2 \rangle - \langle k \rangle^2 = \langle k \rangle^2 + \langle k \rangle - \langle k \rangle^2 = \langle k \rangle.$$

🧱 So standard deviation σ is equal to $\sqrt{\langle k \rangle}$.

Poisson basics:

🧱 The **variance** of degree distributions for random networks turns out to be **very important**.

🧱 Using calculation similar to one for finding $\langle k \rangle$ we find the **second moment** to be:

$$\langle k^2 \rangle = \langle k \rangle^2 + \langle k \rangle.$$

🧱 Variance is then

$$\sigma^2 = \langle k^2 \rangle - \langle k \rangle^2 = \langle k \rangle^2 + \langle k \rangle - \langle k \rangle^2 = \langle k \rangle.$$

🧱 So standard deviation σ is equal to $\sqrt{\langle k \rangle}$.

🧱 Note: This is a special property of Poisson distribution and can trip us up...

Reason #1:

 Average # friends of friends per node is

$$\langle k_2 \rangle = \langle k \rangle \times \langle k \rangle_R = \langle k \rangle \frac{1}{\langle k \rangle} (\langle k^2 \rangle - \langle k \rangle) = \langle k^2 \rangle - \langle k \rangle.$$

 Key: Average depends on the **1st and 2nd moments** of P_k and **not just the 1st moment**.

 Three peculiarities:

1. We might guess $\langle k_2 \rangle = \langle k \rangle (\langle k \rangle - 1)$ but it's actually $\langle k(k-1) \rangle$.
2. If P_k has a **large second moment**, then $\langle k_2 \rangle$ will be big.

Two reasons why this matters

More on peculiarity #3:

 A node's average # of friends: $\langle k \rangle$

 Friend's average # of friends: $\frac{\langle k^2 \rangle}{\langle k \rangle}$

 Comparison:

$$\frac{\langle k^2 \rangle}{\langle k \rangle} = \langle k \rangle \frac{\langle k^2 \rangle}{\langle k \rangle^2} = \langle k \rangle \frac{\sigma^2 + \langle k \rangle^2}{\langle k \rangle^2} = \langle k \rangle \left(1 + \frac{\sigma^2}{\langle k \rangle^2} \right) \geq \langle k \rangle$$

 So only if everyone has the same degree (variance = $\sigma^2 = 0$) can a node be the same as its friends.

 Intuition: for networks, the more connected a node, the more likely it is to be chosen as a friend.

Structure of random networks

Giant component:

 A giant component exists if when we follow a random edge, we are likely to hit a node with **at least 1** other outgoing edge.

 Equivalently, expect exponential growth in node number as we move out from a random node.

 All of this is the same as requiring $\langle k \rangle_R > 1$.

 **Giant component condition** (or percolation condition):

$$\langle k \rangle_R = \frac{\langle k^2 \rangle - \langle k \rangle}{\langle k \rangle} > 1$$

Structure of random networks

Giant component:

 A giant component exists if when we follow a random edge, we are likely to hit a node with **at least 1** other outgoing edge.

 Equivalently, expect exponential growth in node number as we move out from a random node.

 All of this is the same as requiring $\langle k \rangle_R > 1$.

 **Giant component condition** (or percolation condition):

$$\langle k \rangle_R = \frac{\langle k^2 \rangle - \langle k \rangle}{\langle k \rangle} > 1$$

 Again, see that the second moment is an essential part of the story.

Structure of random networks

Giant component:

🧱 A giant component exists if when we follow a random edge, we are likely to hit a node with **at least 1** other outgoing edge.

🧱 Equivalently, expect exponential growth in node number as we move out from a random node.

🧱 All of this is the same as requiring $\langle k \rangle_R > 1$.

🧱 **Giant component condition** (or percolation condition):

$$\langle k \rangle_R = \frac{\langle k^2 \rangle - \langle k \rangle}{\langle k \rangle} > 1$$

🧱 Again, see that the second moment is an essential part of the story.

🧱 Equivalent statement: $\langle k^2 \rangle > 2\langle k \rangle$

Call **R** the **gain ratio**.

Define B_{k1} as the probability that a node of degree k is infected by a single infected edge.

$$\mathbf{R} = \sum_{k=0}^{\infty} \frac{kP_k}{\langle k \rangle} \bullet \underbrace{(k-1)}_{\substack{\# \text{ outgoing} \\ \text{infected} \\ \text{edges}}} \bullet \underbrace{B_{k1}}_{\substack{\text{Prob. of} \\ \text{infection}}} + \sum_{k=0}^{\infty} \frac{\widehat{kP_k}}{\langle k \rangle}$$

Global spreading condition

We need to find: [2]

R = the average # of infected edges that one random infected edge brings about.

Call **R** the **gain ratio**.

Define B_{k1} as the probability that a node of degree k is infected by a single infected edge.

$$\mathbf{R} = \sum_{k=0}^{\infty} \frac{kP_k}{\langle k \rangle} \cdot \underbrace{(k-1)}_{\substack{\# \text{ outgoing} \\ \text{infected} \\ \text{edges}}} \cdot \underbrace{B_{k1}}_{\substack{\text{Prob. of} \\ \text{infection}}} + \sum_{k=0}^{\infty} \frac{\widehat{kP_k}}{\langle k \rangle} \cdot \underbrace{0}_{\substack{\# \text{ outgoing} \\ \text{infected} \\ \text{edges}}}$$

Global spreading condition

🧱 We need to find: [2]

R = the average # of infected edges that one random infected edge brings about.

🧱 Call **R** the **gain ratio**.

🧱 Define B_{k1} as the probability that a node of degree k is infected by a single infected edge.

$$\mathbf{R} = \sum_{k=0}^{\infty} \frac{kP_k}{\langle k \rangle} \cdot \underbrace{(k-1)}_{\substack{\# \text{ outgoing} \\ \text{infected} \\ \text{edges}}} \cdot \underbrace{B_{k1}}_{\substack{\text{Prob. of} \\ \text{infection}}} + \sum_{k=0}^{\infty} \frac{\widehat{kP_k}}{\langle k \rangle} \cdot \underbrace{0}_{\substack{\# \text{ outgoing} \\ \text{infected} \\ \text{edges}}} \cdot \underbrace{(1 - B_{k1})}_{\substack{\text{Prob. of} \\ \text{no infection}}}$$

Global spreading condition

Our global spreading condition is then:

$$\mathbf{R} = \sum_{k=0}^{\infty} \frac{k P_k}{\langle k \rangle} \cdot (k - 1) \cdot B_{k1} > 1.$$

$$\begin{aligned}\delta &= \sum_{k=0}^{\infty} P_k \delta^k = \sum_{k=0}^{\infty} \frac{\langle k \rangle^k}{k!} e^{-\langle k \rangle} \delta^k \\ &= e^{-\langle k \rangle} \sum_{k=0}^{\infty} \frac{(\langle k \rangle \delta)^k}{k!} \\ &= e^{-\langle k \rangle} e^{\langle k \rangle \delta} = e^{-\langle k \rangle(1-\delta)}.\end{aligned}$$

 Now substitute in $\delta = 1 - S_1$ and rearrange to obtain:

$$S_1 = 1 - e^{-\langle k \rangle S_1}.$$

 We can figure out some limits and details for $S_1 = 1 - e^{-\langle k \rangle S_1}$.

 First, we can write $\langle k \rangle$ in terms of S_1 :

$$\langle k \rangle = \frac{1}{S_1} \ln \frac{1}{1 - S_1}.$$
