## What one might expect:

### $\alpha = 2/3$ because ...

Dimensional analysis suggests an energy balance surface law:

 $P\propto S\propto V^{2/3}\propto M^{2/3}$ 

### Lognormal fluctuations:

Gaussian fluctuations in  $\log_{10} P$  around  $\log_{10} cM^{\alpha}$ .

Stefan-Boltzmann law ☐ for radiated energy:

$$\frac{\mathrm{d}E}{\mathrm{d}t} = \sigma\varepsilon ST^4 \propto S$$

Measuring exponents

**River networks** 

Earlier theories

Geometric argument

Conclusion

References

na 10 of 126

$$\alpha = 3/4$$

$$P \propto M^{3/4}$$

### Huh?

# The prevailing belief of the Church of Quarterology:

Most obvious concern:

$$3/4 - 2/3 = 1/12$$

- An exponent higher than 2/3 points suggests a fundamental inefficiency in biology.
- Organisms must somehow be running 'hotter' than they need to balance heat loss.

### The great 'law' of heartbeats:

### Assuming:

Average lifespan  $\propto M^{\beta}$ Average heart rate  $\propto M^{-\beta}$ Irrelevant but perhaps  $\beta = 1/4$ .

### Then:

Average number of heart beats in a lifespan  $\simeq$  (Average lifespan) × (Average heart rate)  $\propto M^{\beta-\beta}$  $\propto M^{0}$ 

Number of heartbeats per life time is independent of organism size!

 $\circledast$   $\approx$  1.5 billion ....

### From PoCS, the Prequel to CocoNuTs:

"How fast do living organisms move: Maximum speeds from bacteria to elephants and whales" Meyer-Vernet and Rospars, American Journal of Physics, **83**, 719–722, 2015. <sup>[35]</sup>

Fig. 1. Maximum relative speed versus body mass for 202 running species (157 mammals plotted in magenta and 45 non-mammals plotted in green), 127 winning species and 91 micro-organisms (plotted in blue). The sources of the data are given in Ref. 16. The solid line is the maximum relative speed [Eq. (13)] estimated in Sec. III. The human world records are plotted as asterisks (upper for running and lower for swimming). Some examples of organisms of various masses are sketched in black (drawings by François Meyer). 2 Q C 32 of 126

UVN OO

### Measuring exponents

Relationship to ordinary least squares regression is simple:

 $\begin{aligned} \mathsf{slope}_{\mathsf{SMA}} &= r^{-1} \times \mathsf{slope}_{\mathsf{OLS} \ y \ \mathsf{on} \ x} \\ &= r \times \mathsf{slope}_{\mathsf{OLS} \ x \ \mathsf{on} \ y} \end{aligned}$ 

where *r* = standard correlation coefficient:

$$r = \frac{\sum_{i=1}^{n} (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^{n} (x_i - \bar{x})^2} \sqrt{\sum_{i=1}^{n} (y_i - \bar{y})^2}}$$

Groovy upshot: If (1) a paper uses OLS regression when RMA would be appropriate, and (2) r is reported, we can figure out the RMA slope. <sup>[41, 29]</sup> PoCS @pocsvox

## Analysis of residuals

- 1. Presume an exponent of your choice: 2/3 or 3/4.
- 2. Fit the prefactor  $(\log_{10} c)$  and then examine the residuals:

$$r_i = \log_{10} B_i - (\alpha' \log_{10} M_i - \log_{10} c).$$

- 3.  $H_0$ : residuals are uncorrelated  $H_1$ : residuals are correlated.
- Measure the correlations in the residuals and compute a *p*-value.

# Analysis of residuals

We use the spiffing Spearman Rank-Order Correlation Coefficient

## Basic idea:

2

Siven  $\{(x_i, y_i)\}$ , rank the  $\{x_i\}$  and  $\{y_i\}$  separately from smallest to largest. Call these ranks  $R_i$  and  $S_i$ .

Now calculate correlation coefficient for ranks,  $r_s$ :

$$r_s = \frac{\sum_{i=1}^n (R_i - \bar{R})(S_i - \bar{S})}{\sqrt{\sum_{i=1}^n (R_i - \bar{R})^2} \sqrt{\sum_{i=1}^n (S_i - \bar{S})^2}}$$

# Analysis of residuals

## We assume all rank orderings are equally likely:

- $r_s$  is distributed according to a Student's *t*-distribution  $\mathbb{C}$  with N-2 degrees of freedom.
- Excellent feature: Non-parametric—real distribution of x's and y's doesn't matter.
- Bonus: works for non-linear monotonic relationships as well.
- See Numerical Recipes in C/Fortran which contains many good things. [39]

So: The exponent  $\alpha = 2/3$  works for all birds and mammals up to 10–30 kg

- For mammals > 10–30 kg, maybe we have a new scaling regime
- Possible connection?: Economos (1983)—limb length break in scaling around 20 kg<sup>[15]</sup>
- But see later: non-isometric growth leads to lower metabolic scaling. Oops.

# The widening gyre:

### Now we're really confused (empirically):

- Solution White and Seymour, 2005: unhappy with large herbivore measurements <sup>[56]</sup>. Pro 2/3: Find  $\alpha \simeq 0.686 \pm 0.014$ .

## Connecting network structure to $\alpha$

1. Ratios of network parameters:

$$R_n = \frac{n_{k+1}}{n_k}, \ R_\ell = \frac{\ell_{k+1}}{\ell_k}, \ R_r = \frac{r_{k+1}}{r_k}$$

2. Number of capillaries  $\propto P \propto M^{\alpha}$ .

$$\Rightarrow \quad \alpha = -\frac{\ln R_n}{\ln R_r^2 R_\ell}$$

(also problematic due to prefactor issues)

Obliviously soldiering on, we could assert:

 $\ref{eq:space-fillingness:} R_\ell = R_n^{-1/3}$ 

$$\Rightarrow \alpha = 3/4$$

For  $0 \le \epsilon < 1/2$ , approximate network volume by integral over region:

$$\mathrm{min} V_{\mathrm{net}} \propto \int_{\Omega_{d,D}(V)} \rho \, ||\vec{x}||^{1-2\epsilon} \, \mathrm{d} \vec{x}$$

Insert question from assignment 4 🗹

 $\propto \rho V^{1+\gamma_{\max}(1-2\epsilon)}$  where  $\gamma_{\max} = \max_i \gamma_i$ .

For  $\epsilon > 1/2$ , find simply that

 ${\rm min}V_{\rm net}\propto\rho V$ 

So if supply lines can taper fast enough and without limit, minimum network volume can be made negligible. PoCS @pocsvox

Optimal Supply Networks II

Metabolism and Truthicide

Death by fractions

Measuring exponents

River networks

Earlier theories

Geometric argument Conclusion References

UVN S

#### For $0 \le \epsilon < 1/2$ :

 $\min V_{\rm net} \propto \rho V^{1+\gamma_{\rm max}(1-2\epsilon)}$ 

 $\Im$  If scaling is isometric, we have  $\gamma_{max} = 1/d$ :

 ${\rm min}V_{\rm net/iso} \propto \rho V^{1+(1-2\epsilon)/d}$ 

 If scaling is allometric, we have  $\gamma_{\rm max} = \gamma_{\rm allo} > 1/d$ : and

 ${\rm min}V_{\rm net/allo} \propto \rho V^{1+(1-2\epsilon)\gamma_{\rm allo}}$ 

Isometrically growing volumes require less network volume than allometrically growing volumes:

 $\frac{\min V_{\mathsf{net/iso}}}{\min V_{\mathsf{net/allo}}} \to 0 \text{ as } V \to \infty$

The constant

UVN S

#### For $\epsilon > 1/2$ :

#### ${\rm min}V_{\rm net}\propto \rho V$

Network volume scaling is now independent of overall shape scaling.

#### Limits to scaling

- Can argue that 
  empty must effectively be 0 for real networks over large enough scales.
- Limit to how fast material can move, and how small material packages can be.
  - e.g., blood velocity and blood cell size.

This is a really clean slide

## **Blood networks**

- Solution Velocity at capillaries and aorta approximately constant across body size <sup>[51]</sup>:  $\epsilon = 0$ .
- Sor cardiovascular networks, d = D = 3.
- Blood volume scales linearly with body volume [47],  $V_{\rm net} \propto V$ .
- 🚳 Sink density must .. decrease as volume increases:

$$ho \propto V^{-1/d}$$

Density of suppliable sinks decreases with organism size.

## **Blood networks**

Then *P*, the rate of overall energy use in Ω, can at most scale with volume as

 $P\propto \rho V\propto \rho\,M\propto M^{\,(d-1)/d}$ 

So For d = 3 dimensional organisms, we have

 $P \propto M^{\,2/3}$ 

Including other constraints may raise scaling exponent to a higher, less efficient value.

- The exponent  $\alpha = 2/3$  works for all birds and mammals up to 10–30 kg
- For mammals > 10–30 kg, maybe we have a new scaling regime
- Economos: limb length break in scaling around 20 kg
- Solution White and Seymour, 2005: unhappy with large herbivore measurements. Find  $\alpha \simeq 0.686 \pm 0.014$

## Prefactor:

## Stefan-Boltzmann law: 🖸

where S is surface and T is temperature.

Very rough estimate of prefactor based on scaling of normal mammalian body temperature and surface area S:

 $B \simeq 10^5 M^{2/3} \mathrm{erg/sec.}$ 

3 Measured for  $M \leq 10$  kg:

 $B = 2.57 \times 10^5 M^{2/3}$ erg/sec.

#### **River networks**

Wiew river networks as collection networks.
 Many sources and one sink.

 *ϵ*?

Assume  $\rho$  is constant over time and  $\epsilon = 0$ :

 $V_{\rm net} \propto 
ho V^{(d+1)/d} = {\rm constant} imes V^{3/2}$ 

Network volume grows faster than basin 'volume' (really area).

\lambda It's all okay:

Landscapes are d=2 surfaces living in D=3 dimensions.

Streams can grow not just in width but in depth ...

If  $\epsilon > 0$ ,  $V_{net}$  will grow more slowly but 3/2 appears to be confirmed from real data.

There is an apocryphal story about a graduate mathematics student at the University of Virginia studying the properties of certain mathematical objects. In his fifth year some killjoy bastard elsewhere published a paper proving that there are no such mathematical objects. He dropped out of the program, and I never did hear where

he is today. He's probably making my cappuccino right now.

This week, a professor named Peter Sheridan Dodds published a new paper in *Physical Review Letters* further fleshing out a theory concerning why a 2/3 power law may apply for metabolic rate. The 2/3 law says that metabolic rate in animals rises as the 2/3 power of body mass. It was in a 2001 *Journal of Theoretical Biology* paper that he first argued that perhaps a 2/3 law applies, and that paper – – along with others such as the one that just appeared –– is what has put him in the Killjoy Hall of Fame. The University of Virginia's Killjoy was a mere amateur.

## Artisanal, handcrafted silliness:

"Critical truths about power laws" <sup>[48]</sup> Stumpf and Porter, Science, 2012

How good is your power law? The chart reflects the level of statistical support—as measured in (16, 21)—and our opinion about the mechanistic sophistication underlying hypothetical generative models for various reported power laws. Some relationships are identified by name; the others reflect the general characteristics of a wide range of reported power laws. Allometric scaling stands out from the other power laws reported for complex systems.

 Call generalization of Central Limit Theorem, stable distributions. Also: PLIPLO action.
 Summary: Wow. PoCS @pocsvox

## Conclusion

- Supply network story consistent with dimensional analysis.
- Isometrically growing regions can be more efficiently supplied than allometrically growing ones.
- Ambient and region dimensions matter (D = d versus D > d).
- Deviations from optimal scaling suggest inefficiency (e.g., gravity for organisms, geological boundaries).
- Actual details of branching networks not that important.
- 🚳 Exact nature of self-similarity varies.
- 2/3-scaling lives on, largely in hiding.
- ling? Jury ruled a mistrial.
- 🗞 The truth will out. Maybe.
