Scaling-at-large Allometr

 $\Rightarrow \log_{k} y = \alpha \log_{k} x + \log_{k} c$

with slope equal to α , the scaling exponent.

Much searching for straight lines on log-log or double-logarithmic plots.

Good practice: Always, always, always use base 10.

But: hands.¹And social pressure.

Talk only about orders of magnitude (powers of 10).

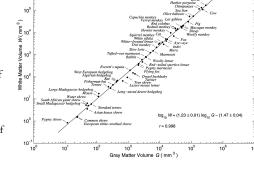

A beautiful, heart-warming example:

A = volume ofgray matter: 'computing elements'

A = Volume ofwhite matter:

'wiring'

from Zhang & Sejnowski, PNAS (2000) [40]

WELL OF SCALES

THE SUN ~

¹Probably an accident of evolution—debated.

Why is $\alpha \simeq 1.23$?

Quantities (following Zhang and Sejnowski):

- $\Re G = \text{Volume of gray matter (cortex/processors)}$
- & W = Volume of white matter (wiring)
- Rrightarrow T = Cortical thickness (wiring)
- A = Cortical surface area
- & L = Average length of white matter fibers

A rough understanding:

- $G \sim ST$ (convolutions are okay)
- $\Re W \sim \frac{1}{2}pSL$
- $G \sim L^3$
- \Leftrightarrow Eliminate S and L to find $W \propto G^{4/3}/T$

Why is $\alpha \simeq 1.23$?

A rough understanding:

Tricksiness:

- & We are here: $W \propto G^{4/3}/T$
- $\ensuremath{\mathfrak{S}}$ Observe weak scaling $T \propto G^{0.10 \pm 0.02}$.

 $og_{10} G = (0.955 \pm 0.002) log_{10} V + (0.061 \pm 0.009)$

 $\log_{10} W = (1.174 \pm 0.007) \log_{10} V - (1.40 \pm 0.03)$

 10^3 10^4 10^5 Total Volume $V = G + W (\text{mm}^3)$

Definitions

Power laws are the signature of scale invariance:

Scale invariant 'objects' look the 'same' when they are appropriately rescaled.

- Solutions = geometric shapes, time series, functions, relationships, distributions,...
- & 'Same' might be 'statistically the same'
- To rescale means to change the units of measurement for the relevant variables

Scale invariance

Our friend $y = cx^{\alpha}$:

Technology Specialization References

8

If we rescale x as x = rx' and y as $y = r^{\alpha}y'$,

 $r^{\alpha}y' = c(rx')^{\alpha}$

 $\Rightarrow y' = cr^{\alpha}x'^{\alpha}r^{-\alpha}$

$\Rightarrow y' = cx'^{\alpha}$

Scale invariance

Compare with $y = ce^{-\lambda x}$:

A If we rescale x as x = rx', then

 $y = ce^{-\lambda rx'}$

- Original form cannot be recovered.
- Scale matters for the exponential.

More on $y = ce^{-\lambda x}$:

- \Re Say $x_0 = 1/\lambda$ is the characteristic scale.
- \Re For $x \gg x_0$, y is small, while for $x \ll x_0$, y is large.

 \mathbb{R} With V = G + W, some power laws must be approximations.

r = 0.9998

Measuring exponents is a hairy business...

Isometry:

Dimensions scale linearly with each other.

Allometry:

Dimensions scale nonlinearly.

Allometry:

- Refers to differential growth rates of the parts of a living organism's body part or process.
- First proposed by Huxley and Teissier, Nature, 1936 "Terminology of relative growth" [15, 35]

Definitions

- Allo-metry = 'other measure'

We use allometric scaling to refer to both:

- 1. Nonlinear scaling of a dependent variable on an independent
- 2. The relative scaling of correlated measures

Dimensional analysis suggests an energy balance surface law:

- Assumes isometric scaling (not quite the spherical cow).
- & Lognormal fluctuations:

Gaussian fluctuations in $\log P$ around $\log cM^{\alpha}$.

& Stefan-Boltzmann law of for radiated energy:

$$\frac{\mathrm{d}E}{\mathrm{d}t} = \sigma \varepsilon S T^4 \propto$$

 $\alpha = 2/3$ because ...

 $P \propto S \propto V^{2/3} \propto M^{2/3}$

$$\frac{\mathrm{d}E}{\mathrm{d}t} = \sigma \varepsilon S T^4 \propto S$$

The prevailing belief of the Church of Quarterology:

 $\alpha = 3/4$

 $P \propto M^{\,3/4}$

Huh?

Fundamental equations cannot depend on units:

- System involves n related quantities with some unknown equation $f(q_1,q_2,\dots,q_n)=0.$
- Seometric ex.: area of a square, side length ℓ : $A = \ell^2$ where $[A] = L^2$ and $[\ell] = L$.
- Rewrite as a relation of $p \le n$ independent dimensionless parameters \square where p is the number of independent dimensions (mass, length, time, luminous intensity ...):

$$F(\pi_1,\pi_2,\dots,\pi_p)=0$$

- $A/\ell^2 1 = 0$ where $\pi_1 = A/\ell^2$.
- Another example: $F = ma \Rightarrow F/ma 1 = 0$.
- Plan: solve problems using only backs of envelopes.

Example:

Simple pendulum:

- Idealized mass/platypus swinging forever.
- Sour quantities:
 - 1. Length ℓ ,
 - 2. mass m,
 - 3. gravitational acceleration q,
 - 4. pendulum's period τ .
- & Variable dimensions: $[\ell] = L, [m] = M, [g] = LT^{-2},$ and $[\tau] = T$.
- \mathcal{E} Turn over your envelopes and find some π 's.

A little formalism:

- Game: find all possible independent combinations of the $\{q_1,q_2,\ldots,q_n\},$ that form dimensionless quantities $\{\pi_1, \pi_2, \dots, \pi_p\}$, where we need to figure out p (which must be $\leq n$).
- \mathfrak{S} Consider $\pi_i = q_1^{x_1} q_2^{x_2} \cdots q_n^{x_n}$.
- & We (desperately) want to find all sets of powers x_i that create dimensionless quantities.
- \mathbb{A} Dimensions: want $[\pi_i] = [q_1]^{x_1} [q_2]^{x_2} \cdots [q_n]^{x_n} = 1$.
- For the platypus pendulum we have $[q_1] = L, [q_2] = M, [q_3] = LT^{-2},$ and $[q_4] = T,$ with dimensions $d_1 = L$, $d_2 = M$, and $d_3 = T$.
- \Re So: $[\pi_i] = L^{x_1} M^{x_2} (LT^{-2})^{x_3} T^{x_4}$.
- \Re We regroup: $[\pi_i] = L^{x_1+x_3}M^{x_2}T^{-2x_3+x_4}$.
- $x_1 + x_2 = 0, x_2 = 0, \text{ and } -2x_2 + x_4 = 0.$
- Time for matrixology ...

Well, of course there are matrices:

Thrillingly, we have:

Scaling in Cities:

Intriguing findings:

 \mathfrak{S} Global supply costs scale sublinearly with $N(\beta < 1)$.

Returns to scale for infrastructure.

Total individual costs scale linearly with $N(\beta = 1)$

- Individuals consume similar amounts independent of city
- Social quantities scale superlinearly with $N(\beta > 1)$
 - Creativity (# patents), wealth, disease, crime, ...

Density doesn't seem to matter...

Surprising given that across the world, we observe two orders of magnitude variation in area covered by agglomerations of fixed populations.

"Urban scaling and its deviations: Revealing the structure of wealth, innovation and crime across cities"

Bettencourt et al., PLoS ONE, 5, e13541, 2010. [5]

Comparing city features across populations:

- Cities = Metropolitan Statistical Areas (MSAs)
- Story: Fit scaling law and examine residuals
- Noes a city have more or less crime than expected when normalized for population?
- Same idea as Encephalization Quotient (EQ).

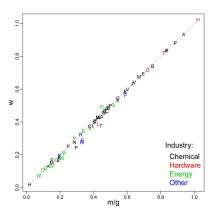

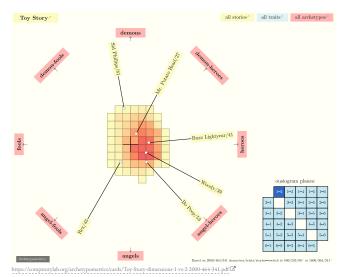

Figure 4. An illustration that the combination of exponentially increasing production and exponentially decreasing cost are equivalent to Wright's law. The value of the Wright parameter in is plotted against the prediction m/g based on the Sahal formula, where m is the exponent of cost reduction and g the exponent of the increase in cumulative production.

Toy Story and Moore's law:

'When the group moved to California to become part of Lucasfilm, we got close to making a computer-animated movie again in the mid-1980s - this time about a monkey with godlike powers but a missing prefrontal cortex. We had a sponsor, a story treatment, and a marketing survey. We were prepared to make a screen test: Our hot young animator John Lasseter had sketched numerous studies of the hero monkey and had the sponsor salivating over a glass-dragon protagonist.'

7"How Pixar Used Moore's Law to Predict the Future," Wired, 2013/04/17 https:

//www.wired.com/2013/04/how-pixar-used-moores-law-to-predict-the-future/

Toy Story and Moore's law:

"But when it came time to harden the deal and run the numbers for the contracts, I discovered to my dismay that computers were still too slow: The projected production cost was too high and the computation time way too long. We had to back out of the deal. This time, we did know enough detail to correctly apply Moore's Law – and it told us that we had to wait another five years to start making the first movie. And sure enough, five years later Disney approached us to make Toy Story."

Toy Story and Moore's law:

'We implement each step to see if it actually works, then gain the courage, the insight, and the engineering mastery to proceed to the next step.

Moore's Law told us that the new company we were starting, Pixar, had to bide its time—building hardware instead of making movies.'

Toy Story and Moore's law:

Atoms:

1. Type: Atom

2. Thing: Element (stuff made of a given atom; e.g., gold)

3. Measure: Mass; could be Number.

4. Experience: Atomic bonds.

Sizes and Rankings:

& We will often consider systems where each component type auhas at least one measurable—and hence rankable—'size' s_{π} .

Perceived size is a combination of Measure (what exists) and Experience (what is measured).

🚵 Important: We may also have rankings where we do not know the underlying 'size' (e.g., book/thing sales on Amazon).

A key framing from language:

Types and Tokens:

- In linguistics, words are described on the two levels of types and tokens [32].
- A In semiotics, signs can be thought of having two components of the signified and the signifier .

Example:

- ∴ Types are 1-grams ☑, e.g., '!', 'the', 'love', and 'spork'.
- Tokens are 1-grams as written down.
- In "Pride and Prejudice", for example, there are 498 '!'s, 4,058 'the's, 90 'love's, and 0 'spork's.

1. Type: Water molecule, H²O.

2. Thing: Water.

3. Measure: Volume (liters, gallons); given pressure and temperature, equivalent to Number (counts of molecules) and then Mass.

4. Experience: Rain.

Water:

& Example type: The species Ornithorhynchus anatinus, the

Thing: Any given platypus.

Measure: The number of platypuses ('instances' of the species) living in Australia in the wild.

Experience: Seeing a platypus in the wild; being hunted by a platypus.

Three examples which show some of the range of what 'size' can mean:

1. Size for a word in a corpus means the number of indistinguishable instances of that word (many identical entites—tokens);

2. Size for species means the number of 'biological replications' of an individual type (many genetically similar entities of varying ages); and

3. Size for a corporation might mean monetary value (market cap, one entity).

4. May have more than one measure of a system:

Total biomass of a species. 10

Number of employees in a corporation.

Number of stars in a galaxy. 10

5. Measure of size allows for rankings.

6. Again, sizes may be hidden.

10 Somewhat hard to estimate.

Types and Things and Measures, Oh My!

Beyond language:

Lift out and expand the type-token framing to complex systems in general.

Three Four possible parts:

- 1. Type: A kind or class of category of individual things based on shared characteristics.
- 2. Thing: An individual manifestation of a type.
- 3. Measure: A quantification of the manifestation of things.
- 4. Experience: An interaction of any kind with a manifestation of a type.9

Moneyspace:

- & Example type: Corporation.
- Things: The publicly traded companies of Apple and Microsoft.
- Measure: Market capitalization.
- Experience: Being sued by Microsoft.
- Apple and Microsoft may be viewed as components of the publicly-owned corporate world.
- The sizes of corporations may be broken down into many rankable dimensions such as annual revenue or number of employees worldwide.
- In principle, market capitalization represents a kind of current collective belief in terms of money.

When tokens are fungible:

Randomly permute all of the words (tokens) of the same type in Pride and Prejudice.

Measure and Experience will be unchanged.

NFTs: Non-fungible tokens.

Tricking people into thinking tokens are types.

"The Oxymoron for Morons."

When tokens are funguses:

- NFF: Non-fungible fungus (from a sentient fungus's point of
- Lack of exposure leads to fungibility of "the other." 11

view).

But in cooking, funguses are fungible.

9Fame.

¹¹ Universal: Identical twins look the same until they don't

Shell of the nut:

- Scaling is a fundamental feature of complex systems.
- Basic distinction between isometric and allometric scaling.
- Powerful envelope-based approach: Dimensional analysis.
- Oh yeah, well that's just dimensional analysis" said the [insert your own adjective] physicist.
- Tricksiness: A wide variety of mechanisms give rise to scalings.¹²
- Some mechanisms are common, some are rare. 13
