Thresholds

- Basic idea: individuals adopt a behavior when a **certain fraction of others** have adopted
- 'Others' may be everyone in a population, an individual's close friends, any reference group.
- Response can be probabilistic or deterministic.
- Individual thresholds can vary
- Assumption: order of others' adoption does not matter... **(unrealistic)**.

Snowballing

First study random networks:

- Start with N nodes with a degree distribution P_k
- Nodes are randomly connected (carefully so)
- Aim: Figure out when activation will propagate
- Determine a **cascade condition**

The Cascade Condition:

- If one individual is initially activated, what is the probability that an activation will spread over a network?

Snowballing

First study random networks:

- Start with N nodes with a degree distribution P_k
- Nodes are randomly connected (carefully so)
- Aim: Figure out when activation will propagate
- Determine a **cascade condition**

The Cascade Condition:

1. If one individual is initially activated, what is the probability that an activation will spread over a network?
2. What features of a network determine whether a cascade will occur or not?

Example random network structure:

 $\Omega_{crit} = \Omega_{vuln} =$
critical mass =
global vulnerable
component

 $\Omega_{trig} =$ triggering
component

 $\Omega_{final} =$ potential
extent of spread

 $\Omega =$ entire
network

$$\Omega_{crit} \subset \Omega_{trig}; \Omega_{crit} \subset \Omega_{final}; \text{ and } \Omega_{trig}, \Omega_{final} \subset \Omega.$$

-  Not obvious even for uniform threshold problem.
-  Difficulty is in figuring out if and when nodes that need ≥ 2 hits switch on.
-  Problem **beautifully solved** for infinite seed case by Gleeson and Cahalane:
“Seed size strongly affects cascades on random networks,”
Phys. Rev. E, 2007. ^[14]
-  Developed further by Gleeson in “Cascades on correlated and modular random networks,” Phys. Rev. E, 2008. ^[13]

Determining expected size of spread:

Randomly turn on a fraction ϕ_0 of nodes at time $t = 0$

 Not just for threshold model—works for a wide range of contagion processes.

Expected size of spread

Notes:

-  Calculations are possible if nodes do not become inactive (strong restriction).
-  Not just for threshold model—works for a wide range of contagion processes.
-  We can analytically determine the entire time evolution, not just the final size.

Expected size of spread

Notes:

- Calculations are possible if nodes do not become inactive (strong restriction).
- Not just for threshold model—works for a wide range of contagion processes.
- We can analytically determine the entire time evolution, not just the final size.
- We can in fact determine $\Pr(\text{node of degree } k \text{ switching on at time } t)$.

Expected size of spread

Notes:

- Calculations are possible if nodes do not become inactive (strong restriction).
- Not just for threshold model—works for a wide range of contagion processes.
- We can analytically determine the entire time evolution, not just the final size.
- We can in fact determine $\Pr(\text{node of degree } k \text{ switching on at time } t)$.
- Asynchronous updating can be handled too.

Expected size of spread

Pleasantness:

 Taking off from a single seed story is about **expansion** away from a node.

Expected size of spread

Pleasantness:

- ✉ Taking off from a single seed story is about **expansion** away from a node.
- ✉ Extent of spreading story is about **contraction** at a node.

Expected size of spread

 **Notation:** $\phi_{k,t} = \Pr(\text{a degree } k \text{ node is active at time } t)$.

Expected size of spread

 **Notation:** $\phi_{k,t} = \Pr(\text{a degree } k \text{ node is active at time } t).$

 **Notation:** $B_{kj} = \Pr(\text{a degree } k \text{ node becomes active if } j \text{ neighbors are active}).$

Expected size of spread

-  **Notation:** $\phi_{k,t} = \Pr(\text{a degree } k \text{ node is active at time } t)$.
-  **Notation:** $B_{kj} = \Pr(\text{a degree } k \text{ node becomes active if } j \text{ neighbors are active})$.
-  Our starting point: $\phi_{k,0} = \phi_0$.

Expected size of spread

-  **Notation:** $\phi_{k,t} = \mathbf{Pr}$ (a degree k node is active at time t).
-  **Notation:** $B_{kj} = \mathbf{Pr}$ (a degree k node becomes active if j neighbors are active).
-  Our starting point: $\phi_{k,0} = \phi_0$.
-  $\binom{k}{j} \phi_0^j (1 - \phi_0)^{k-j} = \mathbf{Pr}$ (j of a degree k node's neighbors were seeded at time $t = 0$).

Expected size of spread

-  **Notation:** $\phi_{k,t} = \mathbf{Pr}$ (a degree k node is active at time t).
-  **Notation:** $B_{kj} = \mathbf{Pr}$ (a degree k node becomes active if j neighbors are active).
-  Our starting point: $\phi_{k,0} = \phi_0$.
-  $\binom{k}{j} \phi_0^j (1 - \phi_0)^{k-j} = \mathbf{Pr}$ (j of a degree k node's neighbors were seeded at time $t = 0$).
-  Probability a degree k node was a seed at $t = 0$ is ϕ_0 (as above).

Expected size of spread

- 🧱 **Notation:** $\phi_{k,t} = \mathbf{Pr}$ (a degree k node is active at time t).
- 🧱 **Notation:** $B_{kj} = \mathbf{Pr}$ (a degree k node becomes active if j neighbors are active).
- 🧱 Our starting point: $\phi_{k,0} = \phi_0$.
- 🧱 $\binom{k}{j} \phi_0^j (1 - \phi_0)^{k-j} = \mathbf{Pr}$ (j of a degree k node's neighbors were seeded at time $t = 0$).
- 🧱 Probability a degree k node was a seed at $t = 0$ is ϕ_0 (as above).
- 🧱 Probability a degree k node was not a seed at $t = 0$ is $(1 - \phi_0)$.

Expected size of spread

-  **Notation:** $\phi_{k,t} = \Pr$ (a degree k node is active at time t).
-  **Notation:** $B_{kj} = \Pr$ (a degree k node becomes active if j neighbors are active).
-  Our starting point: $\phi_{k,0} = \phi_0$.
-  $\binom{k}{j} \phi_0^j (1 - \phi_0)^{k-j} = \Pr$ (j of a degree k node's neighbors were seeded at time $t = 0$).
-  Probability a degree k node was a seed at $t = 0$ is ϕ_0 (as above).
-  Probability a degree k node was not a seed at $t = 0$ is $(1 - \phi_0)$.
-  Combining everything, we have:

$$\phi_{k,1} = \phi_0 + (1 - \phi_0) \sum_{j=0}^k \binom{k}{j} \phi_0^j (1 - \phi_0)^{k-j} B_{kj}.$$

 For general t , we need to know the probability an edge coming into a degree k node at time t is active.

 For general t , we need to know the probability an edge coming into a degree k node at time t is active.

 **Notation:** call this probability θ_t .

For general t , we need to know the probability an edge coming into a degree k node at time t is active.

Notation: call this probability θ_t .

We already know $\theta_0 = \phi_0$.

For general t , we need to know the probability an edge coming into a degree k node at time t is active.

Notation: call this probability θ_t .

We already know $\theta_0 = \phi_0$.

Story analogous to $t = 1$ case. For node i :

$$\phi_{i,t+1} = \phi_0 + (1 - \phi_0) \sum_{j=0}^{k_i} \binom{k_i}{j} \theta_t^j (1 - \theta_t)^{k_i-j} B_{k_i j}.$$

For general t , we need to know the probability an edge coming into a degree k node at time t is active.

Notation: call this probability θ_t .

We already know $\theta_0 = \phi_0$.

Story analogous to $t = 1$ case. For node i :

$$\phi_{i,t+1} = \phi_0 + (1 - \phi_0) \sum_{j=0}^{k_i} \binom{k_i}{j} \theta_t^j (1 - \theta_t)^{k_i-j} B_{k_i j}.$$

Average over all nodes to obtain expression for ϕ_{t+1} :

$$\phi_{t+1} = \phi_0 + (1 - \phi_0) \sum_{k=0}^{\infty} P_k \sum_{j=0}^k \binom{k}{j} \theta_t^j (1 - \theta_t)^{k-j} B_{kj}.$$

For general t , we need to know the probability an edge coming into a degree k node at time t is active.

Notation: call this probability θ_t .

We already know $\theta_0 = \phi_0$.

Story analogous to $t = 1$ case. For node i :

$$\phi_{i,t+1} = \phi_0 + (1 - \phi_0) \sum_{j=0}^{k_i} \binom{k_i}{j} \theta_t^j (1 - \theta_t)^{k_i-j} B_{k_i j}.$$

Average over all nodes to obtain expression for ϕ_{t+1} :

$$\phi_{t+1} = \phi_0 + (1 - \phi_0) \sum_{k=0}^{\infty} P_k \sum_{j=0}^k \binom{k}{j} \theta_t^j (1 - \theta_t)^{k-j} B_{kj}.$$

So we need to compute θ_t ...

For general t , we need to know the probability an edge coming into a degree k node at time t is active.

Notation: call this probability θ_t .

We already know $\theta_0 = \phi_0$.

Story analogous to $t = 1$ case. For node i :

$$\phi_{i,t+1} = \phi_0 + (1 - \phi_0) \sum_{j=0}^{k_i} \binom{k_i}{j} \theta_t^j (1 - \theta_t)^{k_i-j} B_{k_i j}.$$

Average over all nodes to obtain expression for ϕ_{t+1} :

$$\phi_{t+1} = \phi_0 + (1 - \phi_0) \sum_{k=0}^{\infty} P_k \sum_{j=0}^k \binom{k}{j} \theta_t^j (1 - \theta_t)^{k-j} B_{kj}.$$

So we need to compute θ_t ... massive excitement...

Expected size of spread

First connect θ_0 to θ_1 :

 $\theta_1 = \phi_0 +$

$$(1 - \phi_0) \sum_{k=1}^{\infty} \frac{k P_k}{\langle k \rangle} \sum_{j=0}^{k-1} \binom{k-1}{j} \theta_0^j (1 - \theta_0)^{k-1-j} B_{kj}$$

 $\frac{k P_k}{\langle k \rangle} = R_k = \mathbf{Pr}$ (edge connects to a degree k node).

 $\sum_{j=0}^{k-1}$ piece gives \mathbf{Pr} (degree node k activates) of its neighbors
 $k - 1$ incoming neighbors are active.

 ϕ_0 and $(1 - \phi_0)$ terms account for state of node at time $t = 0$.

Expected size of spread

First connect θ_0 to θ_1 :

 $\theta_1 = \phi_0 +$

$$(1 - \phi_0) \sum_{k=1}^{\infty} \frac{k P_k}{\langle k \rangle} \sum_{j=0}^{k-1} \binom{k-1}{j} \theta_0^j (1 - \theta_0)^{k-1-j} B_{kj}$$

 $\frac{k P_k}{\langle k \rangle} = R_k = \mathbf{Pr}$ (edge connects to a degree k node).

 $\sum_{j=0}^{k-1}$ piece gives \mathbf{Pr} (degree node k activates) of its neighbors
 $k - 1$ incoming neighbors are active.

 ϕ_0 and $(1 - \phi_0)$ terms account for state of node at time $t = 0$.

 See this all generalizes to give θ_{t+1} in terms of θ_t ...

Expected size of spread

Two pieces: edges first, and then nodes

$$1. \theta_{t+1} = \underbrace{\phi_0}_{\text{exogenous}}$$

$$+(1 - \phi_0) \underbrace{\sum_{k=1}^{\infty} \frac{k P_k}{\langle k \rangle} \sum_{j=0}^{k-1} \binom{k-1}{j} \theta_t^j (1 - \theta_t)^{k-1-j} B_{kj}}_{\text{social effects}}$$

with $\theta_0 = \phi_0$.

$$2. \phi_{t+1} =$$

$$\underbrace{\phi_0}_{\text{exogenous}} + (1 - \phi_0) \underbrace{\sum_{k=0}^{\infty} P_k \sum_{j=0}^k \binom{k}{j} \theta_t^j (1 - \theta_t)^{k-j} B_{kj}}_{\text{social effects}}.$$

Expected size of spread

Iterative map for θ_t is key:

$$\theta_{t+1} = \underbrace{\phi_0}_{\text{exogenous}}$$

$$+(1 - \phi_0) \underbrace{\sum_{k=1}^{\infty} \frac{k P_k}{\langle k \rangle} \sum_{j=0}^{k-1} \binom{k-1}{j} \theta_t^j (1 - \theta_t)^{k-1-j} B_{kj}}_{\text{social effects}}$$

$$= G(\theta_t; \phi_0)$$

Expected size of spread:

Retrieve cascade condition for spreading from a single seed in limit $\phi_0 \rightarrow 0$.

Expected size of spread:

- Retrieve cascade condition for spreading from a single seed in limit $\phi_0 \rightarrow 0$.
- Depends on map $\theta_{t+1} = G(\theta_t; \phi_0)$.

Expected size of spread:

- Retrieve cascade condition for spreading from a single seed in limit $\phi_0 \rightarrow 0$.
- Depends on map $\theta_{t+1} = G(\theta_t; \phi_0)$.
- First: if self-starters are present, some activation is assured:

$$G(0; \phi_0) = \sum_{k=1}^{\infty} \frac{kP_k}{\langle k \rangle} \bullet B_{k0} > 0.$$

meaning $B_{k0} > 0$ for at least one value of $k \geq 1$.

Expected size of spread:

- Retrieve cascade condition for spreading from a single seed in limit $\phi_0 \rightarrow 0$.
- Depends on map $\theta_{t+1} = G(\theta_t; \phi_0)$.
- First: if self-starters are present, some activation is assured:

$$G(0; \phi_0) = \sum_{k=1}^{\infty} \frac{kP_k}{\langle k \rangle} \bullet B_{k0} > 0.$$

meaning $B_{k0} > 0$ for at least one value of $k \geq 1$.

- If $\theta = 0$ is a fixed point of G (i.e., $G(0; \phi_0) = 0$) then spreading occurs if

$$G'(0; \phi_0) = \sum_{k=0}^{\infty} \frac{kP_k}{\langle k \rangle} \bullet (k-1) \bullet B_{k1} > 1.$$

Expected size of spread:

In words:

 If $G(0; \phi_0) > 0$, spreading must occur because some nodes turn on for free.

Expected size of spread:

In words:

- 🧱 If $G(0; \phi_0) > 0$, spreading must occur because some nodes turn on for free.
- 🧱 If G has an **unstable fixed point** at $\theta = 0$, then cascades are also always possible.

Expected size of spread:

In words:

- 🧱 If $G(0; \phi_0) > 0$, spreading must occur because some nodes turn on for free.
- 🧱 If G has an **unstable fixed point** at $\theta = 0$, then cascades are also always possible.

Non-vanishing seed case:

- 🧱 Cascade condition is more complicated for $\phi_0 > 0$.

Expected size of spread:

In words:

- ☰ If $G(0; \phi_0) > 0$, spreading must occur because some nodes turn on for free.
- ☰ If G has an **unstable fixed point** at $\theta = 0$, then cascades are also always possible.

Non-vanishing seed case:

- ☰ Cascade condition is more complicated for $\phi_0 > 0$.
- ☰ If G has a **stable fixed point** at $\theta = 0$, and an **unstable fixed point** for some $0 < \theta_* < 1$, then for $\theta_0 > \theta_*$, spreading takes off.

Expected size of spread:

In words:

- 🧱 If $G(0; \phi_0) > 0$, spreading must occur because some nodes turn on for free.
- 🧱 If G has an **unstable fixed point** at $\theta = 0$, then cascades are also always possible.

Non-vanishing seed case:

- 🧱 Cascade condition is more complicated for $\phi_0 > 0$.
- 🧱 If G has a **stable fixed point** at $\theta = 0$, and an **unstable fixed point** for some $0 < \theta_* < 1$, then for $\theta_0 > \theta_*$, spreading takes off.
- 🧱 Tricky point: G depends on ϕ_0 , so as we change ϕ_0 , we also change G .

Expected size of spread:

In words:

- ☰ If $G(0; \phi_0) > 0$, spreading must occur because some nodes turn on for free.
- ☰ If G has an **unstable fixed point** at $\theta = 0$, then cascades are also always possible.

Non-vanishing seed case:

- ☰ Cascade condition is more complicated for $\phi_0 > 0$.
- ☰ If G has a **stable fixed point** at $\theta = 0$, and an **unstable fixed point** for some $0 < \theta_* < 1$, then for $\theta_0 > \theta_*$, spreading takes off.
- ☰ Tricky point: G depends on ϕ_0 , so as we change ϕ_0 , we also change G .
- ☰ A version of a critical mass model again.

General fixed point story:

 Given $\theta_0 (= \phi_0)$, θ_∞ will be the nearest stable fixed point, either above or below.

General fixed point story:

 Given $\theta_0 (= \phi_0)$, θ_∞ will be the nearest stable fixed point, either above or below.

 n.b., adjacent fixed points must have opposite stability types.

General fixed point story:

 Given $\theta_0 (= \phi_0)$, θ_∞ will be the nearest stable fixed point, either above or below.

 n.b., adjacent fixed points must have opposite stability types.

 **Important:** Actual form of G depends on ϕ_0 .

General fixed point story:

 Given $\theta_0 (= \phi_0)$, θ_∞ will be the nearest stable fixed point, either above or below.

 n.b., adjacent fixed points must have opposite stability types.

 **Important:** Actual form of G depends on ϕ_0 .

 So choice of ϕ_0 dictates both G and starting point—can't start anywhere for a given G .

“Influentials, Networks, and Public Opinion Formation”

Watts and Dodds,

J. Consum. Res., **34**, 441–458, 2007. [28]

-  Exploration of threshold model of social contagion on various networks.
-  “Influentials” are limited in power.
-  Connected groups of weakly influential-vulnerable” individuals are key.
-  Average individuals can have more power than well connected ones.

The multiplier effect:

Fairly uniform levels of individual influence.

Multiplier effect is mostly below 1.

The multiplier effect:

Skewed influence distribution example.

Special subnetworks can act as triggers

 $\phi = 1/3$ for all nodes

Social contagion

“Without followers, evil cannot spread.” –Leonard Nimoy

Summary

- 🧱 **‘Influential vulnerables’** are key to spread.
- 🧱 Early adopters are mostly vulnerables.
- 🧱 Vulnerable nodes important but not necessary.
- 🧱 Groups may greatly facilitate spread.
- 🧱 Seems that cascade condition is a global one.
- 🧱 Most extreme/unexpected cascades occur in highly connected networks
- 🧱 ‘Influentials’ are posterior constructs.

Social contagion

“Without followers, evil cannot spread.” –Leonard Nimoy

Summary

- 🧱 **‘Influential vulnerables’** are key to spread.
- 🧱 Early adopters are mostly vulnerables.
- 🧱 Vulnerable nodes important but not necessary.
- 🧱 Groups may greatly facilitate spread.
- 🧱 Seems that cascade condition is a global one.
- 🧱 Most extreme/unexpected cascades occur in highly connected networks
- 🧱 ‘Influentials’ are posterior constructs.
- 🧱 Many potential influentials exist.

Social contagion

Implications

 Focus on the influential vulnerables.

Spreading success

Groups

References

Implications

- Focus on **the influential vulnerables**.
- Create entities that can be transmitted successfully through many individuals rather than broadcast from one 'influential.'

Social contagion

Implications

- Focus on **the influential vulnerables**.
- Create entities that can be transmitted successfully through many individuals rather than broadcast from one 'influential.'
- Only **simple ideas** can spread by word-of-mouth.
(Idea of opinion leaders spreads well...)

References

Implications

- Focus on **the influential vulnerables**.
- Create entities that can be transmitted successfully through many individuals rather than broadcast from one 'influential.'
- Only **simple ideas** can spread by word-of-mouth.
(Idea of opinion leaders spreads well...)
- Want enough individuals who will adopt and display.

Implications

- Focus on **the influential vulnerables**.
- Create entities that can be transmitted successfully through many individuals rather than broadcast from one 'influential.'
- Only **simple ideas** can spread by word-of-mouth.
(Idea of opinion leaders spreads well...)
- Want enough individuals who will adopt and display.
- Displaying can be **passive** = free (fashion),
or **active** = harder to achieve (political messages; even so:
buttons and hats).

Social contagion

Implications

- Focus on **the influential vulnerables**.
- Create entities that can be transmitted successfully through many individuals rather than broadcast from one 'influential.'
- Only **simple ideas** can spread by word-of-mouth.
(Idea of opinion leaders spreads well...)
- Want enough individuals who will adopt and display.
- Displaying can be **passive** = free (fashion),
or **active** = harder to achieve (political messages; even so:
buttons and hats).
- Entities can be novel or designed to combine with others, e.g.
block another one.
