Benford's Law

References

$$P(\text{first digit} = d) \propto \log_b \left(1 + \frac{1}{d} \right)$$

for certain sets of 'naturally' occurring numbers in base b

Around 30.1% of first digits are '1', compared to only 4.6% for '9'.

First observed by [Simon Newcomb](#) ^[3] in 1881
"Note on the Frequency of Use of the Different Digits in Natural Numbers"

Independently discovered in 1938 by [Frank Benford](#) .

Newcomb almost always noted but Benford gets the stamp, according to [Stigler's Law of Eponymy](#). .

Benford's Law—The Law of First Digits

Observed for

-  Fundamental constants (electron mass, charge, etc.)
-  Utility bills
-  Numbers on tax returns (ha!)
-  Death rates
-  Street addresses
-  Numbers in newspapers

-  Cited as evidence of fraud  in the 2009 Iranian elections.

Essential story

$$\begin{aligned}P(\text{first digit} = d) &\propto \log_b \left(1 + \frac{1}{d}\right) \\ &= \log_b \left(\frac{d+1}{d}\right) \\ &= \log_b (d+1) - \log_b (d)\end{aligned}$$

Observe this distribution if numbers are distributed uniformly in log-space:

$$P(\log_e x) d(\log_e x) \propto 1 \cdot d(\log_e x) = x^{-1} dx = P(x) dx$$

Power law distributions at work again...

Extreme case of $\gamma \simeq 1$.
