HOT forests—Real data:

“Complexity and Robustness,” Carlson & Dolye [6]

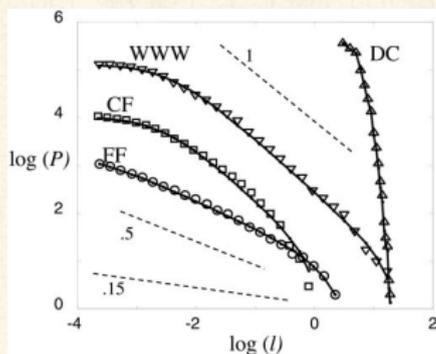

Fig. 1. Log-log (base 10) comparison of DC, WWW, CF, and FF data (symbols) with PLR models (solid lines) (for $\beta = 0, 0.9, 0.9, 1.85$, or $\alpha = 1/\beta = \infty, 1.1, 1.1, 1.054$, respectively) and the SOC FF model ($\alpha = 0.15$, dashed). Reference lines of $\alpha = 0.5, 1$ (dashed) are included. The cumulative distributions of frequencies $\mathcal{P}(l \geq l_i)$ vs. l_i describe the areas burned in the largest 4,284 fires from 1986 to 1995 on all of the U.S. Fish and Wildlife Service Lands (FF) (17), the >10,000 largest California brushfires from 1878 to 1999 (CF) (18), 130,000 web file transfers at Boston University during 1994 and 1995 (WWW) (19), and code words from DC. The size units [1,000 km² (FF and CF), megabytes (WWW), and bytes (DC)] and the logarithmic decimation of the data are chosen for visualization.

These are CCDFs
(Eek: $P, \mathcal{P}(l \geq l_i)$)

PLR = probability-loss-resource.

Minimize cost subject to resource (barrier) constraints:

$$C = \sum_i p_i l_i$$

given

$$l_i = f(r_i) \text{ and } \sum r_i \leq R.$$

DC = Data Compression.

HOT theory:

The abstract story, using figurative forest fires:

 Given some measure of failure size y_i and correlated resource size x_i with relationship $y_i = x_i^{-\alpha}$, $i = 1, \dots, N_{\text{sites}}$.

HOT theory:

The abstract story, using figurative forest fires:

 Given some measure of failure size y_i and correlated resource size x_i with relationship

$$y_i = x_i^{-\alpha}, i = 1, \dots, N_{\text{sites}}.$$

 Design system to minimize $\langle y \rangle$ subject to a constraint on the x_i .

 Minimize cost:

$$C = \sum_{i=1}^{N_{\text{sites}}} \mathbf{Pr}(y_i) y_i$$

HOT theory:

Per unit area, and over same time frame:

$$C_{\text{firewalls}} \propto \sum_{i=1}^{N_{\text{sites}}} a_i^{1/2} a_i^{-1}.$$

 We are assuming **isometry**.

 In d dimensions, $1/2$ is replaced by $(d - 1)/d$

3. Insert assignment question to find:

$$\Pr(a_i) \propto a_i^{-\gamma}.$$

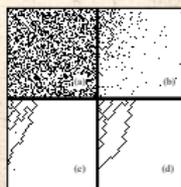

Continuum version:

1. Cost function:

$$\langle C \rangle = \int C(\vec{x})p(\vec{x})d\vec{x}$$

where C is some cost to be evaluated at each point in space \vec{x} (e.g., $V(\vec{x})^\alpha$),

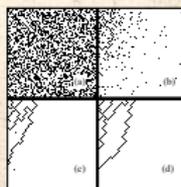

Continuum version:

1. Cost function:

$$\langle C \rangle = \int C(\vec{x})p(\vec{x})d\vec{x}$$

where C is some cost to be evaluated at each point in space \vec{x} (e.g., $V(\vec{x})^\alpha$), and $p(\vec{x})$ is the probability an Ewok jabs position \vec{x} with a sharpened stick (or equivalent).

Continuum version:

1. Cost function:

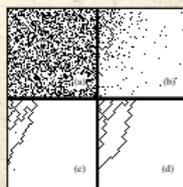

$$\langle C \rangle = \int C(\vec{x})p(\vec{x})d\vec{x}$$

where C is some cost to be evaluated at each point in space \vec{x} (e.g., $V(\vec{x})^\alpha$), and $p(\vec{x})$ is the probability an Ewok jabs position \vec{x} with a sharpened stick (or equivalent).

2. Constraint:

$$\int R(\vec{x})d\vec{x} = c$$

where c is a constant.

Continuum version:

1. Cost function:

$$\langle C \rangle = \int C(\vec{x})p(\vec{x})d\vec{x}$$

where C is some cost to be evaluated at each point in space \vec{x} (e.g., $V(\vec{x})^\alpha$), and $p(\vec{x})$ is the probability an Ewok jabs position \vec{x} with a sharpened stick (or equivalent).

2. Constraint:

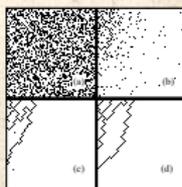

$$\int R(\vec{x})d\vec{x} = c$$

where c is a constant.

Claim/observation is that typically ^[4]

$$V(\vec{x}) \sim R^{-\beta}(\vec{x})$$

Continuum version:

1. Cost function:

$$\langle C \rangle = \int C(\vec{x})p(\vec{x})d\vec{x}$$

where C is some cost to be evaluated at each point in space \vec{x} (e.g., $V(\vec{x})^\alpha$), and $p(\vec{x})$ is the probability an Ewok jabs position \vec{x} with a sharpened stick (or equivalent).

2. Constraint:

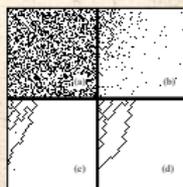

$$\int R(\vec{x})d\vec{x} = c$$

where c is a constant.

 Claim/observation is that typically ^[4]

$$V(\vec{x}) \sim R^{-\beta}(\vec{x})$$

 For spatial systems with barriers: $\beta = d$.

Avoidance of large-scale failures

- Constrained Optimization with Limited Deviations ^[9]
- Weight cost of larges losses more strongly
- Increases average cluster size of burned trees...
- ... but reduces chances of catastrophe
- Power law distribution of fire sizes is truncated

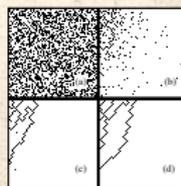

Observed:

 Power law distributions often have an exponential cutoff

$$P(x) \sim x^{-\gamma} e^{-x/x_c}$$

where x_c is the approximate cutoff scale.

Observed:

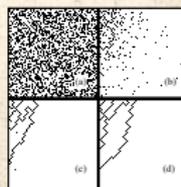

- Power law distributions often have an exponential cutoff

$$P(x) \sim x^{-\gamma} e^{-x/x_c}$$

where x_c is the approximate cutoff scale.

- May be Weibull distributions:

$$P(x) \sim x^{-\gamma} e^{-ax^{-\gamma+1}}$$
