$$r = \sum_{k=1}^{\lfloor \frac{1}{\phi} \rfloor} \frac{(k-1)kP_k}{\langle k \rangle} > 1.$$

- ▶ As $\phi \rightarrow 1$, all nodes become resilient and $r \rightarrow 0$.
- ▶ As $\phi \rightarrow 0$, all nodes become vulnerable and the contagion condition matches up with the giant component condition.
- ▶ **Key:** If we fix ϕ and then vary $\langle k \rangle$, we may see **two** phase transitions.

Contagion condition

- ▶ The contagion condition:

$$r = \sum_{k=1}^{\lfloor \frac{1}{\phi} \rfloor} \frac{(k-1)kP_k}{\langle k \rangle} > 1.$$

- ▶ As $\phi \rightarrow 1$, all nodes become resilient and $r \rightarrow 0$.
- ▶ As $\phi \rightarrow 0$, all nodes become vulnerable and the contagion condition matches up with the giant component condition.
- ▶ **Key:** If we fix ϕ and then vary $\langle k \rangle$, we may see **two** phase transitions.
- ▶ Added to our standard giant component transition, we will see a cut off in spreading as nodes become more connected.

One perspective

“In historical events great men—so-called—are but labels serving to give a name to the event, and like labels they have the least possible connection with the event itself. Every action of theirs, that seems to them an act of their own free will, is in an historical sense not free at all, but in bondage to the whole course of previous history, and predestined from all eternity.”
