# Basics:

- ▶ **Instructor:** Prof. Peter Dodds
- ▶ **Lecture room and meeting times:**  
220 Votey, Tuesday and Thursday, 11:00 am to 12:30 pm
- ▶ **Office:** 203 Lord House, 16 Colchester Avenue
- ▶ **E-mail:** pdodds@uvm.edu
- ▶ **Website:**  
<http://www.uvm.edu/pdodds/teaching/2008-08UVM-300/> (田)
- ▶ **Suggested Texts:**
  - ▶ “Critical Phenomena in Natural Sciences: Chaos, Fractals, Selforganization and Disorder: Concepts and Tools” by Didier Sornette<sup>[12]</sup>.
  - ▶ “Critical Mass: How One Thing Leads to Another” by Philip Ball<sup>[3]</sup>

# Grading breakdown:

- ▶ **Projects/talks (55%)**—Students will work on semester-long projects. Students will develop a proposal in the first few weeks of the course which will be discussed with the instructor for approval. Details: 15% for the first talk, 20% for the final talk, and 20% for the written project.
- ▶ **Assignments (40%)**—All assignments will be of equal weight and there will be three or four of them.
- ▶ **General attendance/Class participation (5%)**

# How grading works:

Questions are worth 3 points according to the following scale:

- ▶ 3 = correct or very nearly so.
- ▶ 2 = acceptable but needs some revisions.
- ▶ 1 = needs major revisions.
- ▶ 0 = way off.

# Important dates:

1. Classes run from Tuesday, September 2nd to Thursday, December 11.
2. Add/Drop, Audit, Pass/No Pass deadline—Monday, September 15.
3. Last day to withdraw—Friday, October 31.
4. Reading and exam period—Friday, December 12th to Friday, December 19th.

## Nino Boccarda in *Modeling Complex Systems*:

[6] “... there is no universally accepted definition of a complex system ... most researchers would describe a system of connected agents that exhibits an emergent global behavior not imposed by a central controller, but resulting from the interactions between the agents.”

## The Wikipedia on Complex Systems:

“Complexity science is not a single theory: it encompasses more than one theoretical framework and is highly interdisciplinary, seeking the answers to some fundamental questions about living, adaptable, changeable systems.”

Philip Ball in *Critical Mass*:

[3] “...complexity theory seeks to understand how order and stability arise from the interactions of many components according to a few simple rules.”

## Cosma Shalizi:

“The "sciences of complexity" are very much a potpourri, and while the name has some justification—chaotic motion seems more complicated than harmonic oscillation, for instance—I think the fact that it is more dignified than "neat nonlinear nonsense" has not been the least reason for its success.—That opinion wasn't exactly changed by working at the Santa Fe Institute for five years.”

## Steve Strogatz in *Sync*:

“... every decade or so, a grandiose theory comes along, bearing similar aspirations and often brandishing an ominous-sounding C-name. In the 1960s it was cybernetics. In the '70s it was catastrophe theory. Then came chaos theory in the '80s and complexity theory in the '90s.”

## Welcome to the COMPLEXITY SOCIETY

### "The Application of Complexity Science to Human Affairs"

The Complexity Society provides a focal point for people in the UK interested in complexity. It is a community that uses complexity science to rethink and reinterpret all aspects of the world in which we live and work.

Its core values are OPENNESS, EQUALITY and DIVERSITY.

- Open to all, open to ideas, open in process and activities
- Equality, egalitarian, non-hierarchical, participative
- Diverse, connecting and embracing a wide range of views, respecting differences

The society objectives are to promote the theory of complexity in education, government, the health service and business as well as the beneficial application of complexity in a wide variety of social, economic, scientific and technological contexts such as sources of competitive advantage, business clusters and knowledge management.

Complexity includes ideas such as complex adaptive systems, self-organisation, co-evolution, agent based computer models, chaos, networks, emergence and fractals.

Membership is open to all and current members include people from universities, business, and government funded organisations.

#### Membership

To join TCS apply here.

#### Complexity Society Newsletter

The August 2007 edition is now available.

#### Complexity Digest

The current issue of Complexity Digest 2007.29 is now available on-line.

#### Recent Events:

Summer School in Complexity Science organised by Imperial College, London, Wye College, Kent, UK. 8-17th July 2007.

#### Forthcoming Events:

ECES'07 European Conference on Complex Systems, Dresden, Germany. 1-5th October 2007.

#### New Paper:

The Fractal Imagination: New Resources for Conceptualising Creativity.

#### Journal

'Emergence: Complexity & Organization (ECO)', A journal of research, theory and practice on Organisations as complex systems.

## Evolution:

- ▶ **Complexity Economics:**

The evolutionary process of differentiation, selection and amplification provides the system with novelty and is responsible for its growth in order and complexity

- ▶ **Traditional Economics:**

No mechanism for endogenously creating novelty, or growth in order and complexity

## Philip Ball in *Critical Mass*:

[3] “... very often what passes today for ‘complexity science’ is really something much older, dressed up in fashionable apparel. The main themes in complexity theory have been studied for more than a hundred years by physicists who evolved a tool kit of concepts and techniques to which complexity studies have barely added a handful of new items.”

- ▶ Statistical Mechanics is “a science of collective behavior.”
- ▶ Simple rules give rise to collective phenomena.

## References

(1) **Entropy**: number of microstates that could underlie a particular macrostate.

- ▶ Used in information theory and statistical mechanics/thermodynamics.
- ▶ Measures how uncertain we are about the details of a system.
- ▶ Problem: Randomness maximizes entropy, perfect order minimizes.
- ▶ Our idea of 'maximal complexity' is somewhere in between...

(Aside)

What about entropy and self-organization?

Isn't entropy supposed to always increase?

(3) Variation on (2): what is the size of a program required to reproduce members of an ensemble of a string of numbers?

Now: Random strings have very low complexity.

So maybe no one true measure of complexity exists.

**Cosma Shalizi:**

“Every few months seems to produce another paper proposing yet another measure of complexity, generally a quantity which can't be computed for anything you'd actually care to know about, if at all. These quantities are almost never related to any other variable, so they form no part of any theory telling us when or how things get complex, and are usually just quantification for quantification's own sweet sake.”
