Contagion

Definition:

- ▶ (1) The spreading of a quality or quantity between individuals in a population.
- (2) A disease itself: the plague, a blight, the dreaded lurgi, ...

Two main classes of contagion:

- Infectious diseases: tuberculosis, HIV, ebola, SARS, influenza, ...
- Social contagion: fashion, word usage, rumors, riots, religion, ...

Frame 3/80

Contagion models

Some large questions concerning network contagion:

- For a given spreading mechanism on a given network, what's the probability that there will be global spreading?
- 2. If spreading does take off, how far will it go?
- 3. How do the details of the network affect the outcome?
- 4. How do the details of the spreading mechanism affect the outcome?
- 5. What if the seed is one or many nodes?

Mathematical Epidemiology

The standard SIR model:

- ► Three states:
 - S = Susceptible
 - ► I = Infected
 - ► R = Recovered

- S(t) + I(t) + R(t) = 1
- Presumes random interactions

Discrete time example:

Transition Probabilities:

 β for being infected given contact with infected r for recovery ρ for loss of immunity

Size distributions

Elsewhere, event size distributions are important:

- earthquakes (Gutenberg-Richter law)
- city sizes, forest fires, war fatalities
- wealth distributions
- 'popularity' (books, music, websites, ideas)
- What about Epidemics?

Power laws distributions are common but not obligatory...

Frame 44/80

Analytic work

- Threshold model completely solved (by 2008):
- ► Cascade condition: [22]

$$\sum_{k=1}^{\infty} k(k-1)\beta_k P_k/z \ge 1.$$

where β_k = probability a degree k node is vulnerable.

- ► Final size of spread figured out by Gleeson and Calahane [9, 8].
- Solution involves finding fixed points of an iterative map of the interval.
- Spreading takes off: expansion
- Spreading reaches a particular node: contraction

Frame 53/80

Social contagion

Summary:

- 'Influential vulnerables' are key to spread.
- Early adopters are mostly vulnerables.
- Vulnerable nodes important but not necessary.
- Groups may greatly facilitate spread.
- Extreme/unexpected cascades may occur in highly connected networks
- Many potential 'influentials' exist.
- Average individuals may be more influential system-wise than locally influential individuals.
- 'Influentials' are posterior constructs.

Summary

References

Frame 55/80

Social contagion

Implications:

- Focus on the influential vulnerables.
- Create entities that many individuals 'out in the wild' will adopt and display rather than broadcast from a few 'influentials.'
- Displaying can be passive = free (yo-yo's, fashion), or active = harder to achieve (political messages).
- Accept that movement of entities will be out of originator's control.
- Possibly only simple ideas can spread by word-of-mouth.

(Idea of opinion leaders has spread well...)

Rosen's theory:

- ▶ Individual quality q maps to reward R(q)
- R(q) is 'convex' $(d^2R/dq^2 > 0)$
- Two reasons:
 - Imperfect substitution:
 A very good surgeon is worth many mediocre ones
 - Technology:
 Media spreads & technology reduces cost of reproduction of books, songs, etc.
- No social element—success follows 'inherent quality'
