Another approach

Benoit Mandelbrot

- ▶ Mandelbrot = father of fractals
- ▶ Mandelbrot = almond bread
- ▶ Derived Zipf's law through optimization^[11]
- ▶ **Idea:** Language is efficient
- ▶ Communicate as **much information as possible** for **as little cost**
- ▶ Need measures of information (H) and cost (C)...
- ▶ Minimize C/H by varying word frequency
- ▶ **Recurring theme:** what role does optimization play in complex systems?

Not everyone is happy... (cont.)

Mandelbrot vs. Simon:

- ▶ Mandelbrot (1961): “Final note on a class of skew distribution functions: analysis and critique of a model due to H.A. Simon”
- ▶ Simon (1961): “Reply to ‘final note’ by Benoit Mandelbrot”
- ▶ Mandelbrot (1961): “Post scriptum to ‘final note’”
- ▶ Simon (1961): “Reply to Dr. Mandelbrot’s post scriptum”

Not everyone is happy... (cont.)

Mandelbrot:

“We shall restate in detail our 1959 objections to Simon’s 1955 model for the Pareto-Yule-Zipf distribution. **Our objections are valid** quite irrespectively of the sign of $p-1$, so that **most of Simon’s (1960) reply was irrelevant.**”

Simon:

“Dr. Mandelbrot has proposed a new set of objections to my 1955 models of the Yule distribution. **Like his earlier objections, these are invalid.**”

Plankton:

“You can’t do this to me, **I WENT TO COLLEGE!**” “You weak minded fool!” “That’s it Mister! You just lost your brain privileges,” etc.

Zipfarama via Optimization

Mandelbrot’s Assumptions

- ▶ Language contains n words: w_1, w_2, \dots, w_n .
- ▶ i th word appears with probability p_i
- ▶ Words appear randomly according to this distribution (obviously not true...)
- ▶ Words = composition of letters is important
- ▶ Alphabet contains m letters
- ▶ Words are ordered by length (shortest first)

Zipfarama via Optimization

Word Cost

- ▶ **Length of word** (plus a space)
- ▶ Word length was irrelevant for Simon’s method

Objection

- ▶ Real words don’t use all letter sequences

Objections to Objection

- ▶ Maybe real words roughly follow this pattern (?)
- ▶ Words can be encoded this way
- ▶ Na na na-na naaaaa...

Zipfarama via Optimization

Binary alphabet plus a space symbol

i	1	2	3	4	5	6	7	8
word	1	10	11	100	101	110	111	1000
length	1	2	2	3	3	3	3	4
$1 + \ln_2 i$	1	2	2.58	3	3.32	3.58	3.81	4

- ▶ Word length of 2^k th word: $= k + 1 = 1 + \log_2 2^k$
- ▶ Word length of i th word $\simeq 1 + \log_2 i$
- ▶ For an alphabet with m letters, word length of i th word $\simeq 1 + \log_m i$.

Zipfarama via Optimization

Total Cost C

- ▶ Cost of the i th word: $C_i \simeq 1 + \log_m i$
- ▶ Cost of the i th word plus space: $C_i \simeq 1 + \log_m(i + 1)$
- ▶ Subtract fixed cost: $C'_i = C_i - 1 \simeq \log_m(i + 1)$
- ▶ Simplify base of logarithm:

$$C'_i \simeq \log_m(i + 1) = \frac{\log_e(i + 1)}{\log_e m} \propto \ln(i + 1)$$

- ▶ Total Cost:

$$C \sim \sum_{i=1}^n p_i C'_i \propto \sum_{i=1}^n p_i \ln(i + 1)$$

Zipfarama via Optimization

Information Measure

- ▶ Use Shannon's Entropy (or Uncertainty):

$$H = - \sum_{i=1}^n p_i \log_2 p_i$$

- ▶ (allegedly) von Neumann suggested 'entropy'...
- ▶ Proportional to average number of bits needed to encode each 'word' based on frequency of occurrence
- ▶ $-\log_2 p_i = \log_2 1/p_i =$ minimum number of bits needed to distinguish event i from all others
- ▶ If $p_i = 1/2$, need only 1 bit ($\log_2 1/p_i = 1$)
- ▶ If $p_i = 1/64$, need 6 bits ($\log_2 1/p_i = 6$)

Zipfarama via Optimization

Information Measure

- ▶ Use a slightly simpler form:

$$H = - \sum_{i=1}^n p_i \log_e p_i / \log_e 2 = -g \sum_{i=1}^n p_i \ln p_i$$

where $g = 1/\ln 2$

Zipfarama via Optimization

- ▶ Minimize

$$F(p_1, p_2, \dots, p_n) = C/H$$

subject to constraint

$$\sum_{i=1}^n p_i = 1$$

- ▶ Tension:
 - (1) Shorter words are **cheaper**
 - (2) Longer words are **more informative** (rarer)
- ▶ (Good) question: how much does choice of C/H as function to minimize affect things?

Zipfarama via Optimization

Time for Lagrange Multipliers:

- ▶ Minimize

$$\Psi(p_1, p_2, \dots, p_n) =$$

$$F(p_1, p_2, \dots, p_n) + \lambda G(p_1, p_2, \dots, p_n)$$

where

$$F(p_1, p_2, \dots, p_n) = \frac{C}{H} = \frac{\sum_{i=1}^n p_i \ln(i+1)}{-g \sum_{i=1}^n p_i \ln p_i}$$

and the constraint function is

$$G(p_1, p_2, \dots, p_n) = \sum_{i=1}^n p_i - 1 = 0$$

Insert question 4, assignment 2 (田)

Zipfarama via Optimization

Some mild suffering leads to:

- ▶
$$p_j = e^{-1-\lambda H^2/gC} (j+1)^{-H/gC} \propto (j+1)^{-H/gC}$$

- ▶ A power law appears [applause]: $\alpha = H/gC$
- ▶ Next: sneakily deduce λ in terms of g , C , and H .
- ▶ Find

$$p_j = (j+1)^{-H/gC}$$

Zipfarama via Optimization

Finding the exponent

- ▶ Now use the normalization constraint:

$$1 = \sum_{j=1}^n p_j = \sum_{j=1}^n (j+1)^{-H/gC} = \sum_{j=1}^n (j+1)^{-\alpha}$$

- ▶ As $n \rightarrow \infty$, we end up with $\zeta(H/gC) = 2$ where ζ is the Riemann Zeta Function
- ▶ Gives $\alpha \simeq 1.73$ (> 1 , too high)
- ▶ If cost function **changes** ($j+1 \rightarrow j+a$) then exponent is tunable
- ▶ Increase a , decrease α

Zipfarama via Optimization

All told:

- ▶ Reasonable approach: Optimization is at work in evolutionary processes
- ▶ But optimization can involve many incommensurate elements: monetary cost, robustness, happiness,...
- ▶ Mandelbrot's argument is not super convincing
- ▶ Exponent depends too much on a loose definition of cost

Forest fire example: [6]

- ▶ Square $N \times N$ grid
- ▶ Sites contain a tree with probability $\rho =$ density
- ▶ Sites are empty with probability $1 - \rho$
- ▶ Fires start at location according to some distribution P_{ij}
- ▶ Fires spread from tree to tree (nearest neighbor only)
- ▶ Connected clusters of trees burn completely
- ▶ Empty sites block fire
- ▶ **Best case scenario:**
Build firebreaks to maximize average # trees left intact

The abstract story:

- ▶ Given $y_i = x_i^{-\alpha}$, $i = 1, \dots, N_{\text{sites}}$
- ▶ Design system to minimize $\langle y \rangle$ subject to a constraint on the x_i
- ▶ Minimize cost:

$$C = \sum_{i=1}^{N_{\text{sites}}} Pr(y_i) y_i$$

Subject to $\sum_{i=1}^{N_{\text{sites}}} x_i = \text{constant}$

- ▶ Drag out the Lagrange Multipliers, battle away and find:

$$p_i \propto y_i^{-\gamma}$$

HOT: Optimal fire walls in d dimensions

Two costs:

1. Expected size of fire

$$C_{\text{fire}} \propto \sum_{i=1}^{N_{\text{sites}}} (p_i a_i) a_i = \sum_{i=1}^{N_{\text{sites}}} p_i a_i^2$$

- ▶ a_i = area of i th site's region
- ▶ p_i = avg. prob. of fire at site in i th site's region
- ▶ N_{sites} = total number of sites

2. Cost of building and maintaining firewalls

$$C_{\text{firewalls}} \propto \sum_{i=1}^{N_{\text{sites}}} a_i^{1/2}$$

- ▶ We are assuming **isometry**.
- ▶ In d dimensions, $1/2$ is replaced by $(d - 1)/d$
