Background Granovetter's model Network version

References

### Two focuses for us

- Widespread media influence
- Word-of-mouth influence

Frame 9/89

### We need to understand influence

- Who influences whom? Very hard to measure...
- What kinds of influence response functions are there?
- Are some individuals super influencers? Highly popularized by Gladwell [8] as 'connectors'
- The infectious idea of opinion leaders (Katz and Lazarsfeld) [12]

  - Social learning theory, Informational cascades,...

Social Contagion Models Background Granovetter's model Network version Groups

References

Frame 23/89

# Social contagion models

### **Thresholds**

- Basic idea: individuals adopt a behavior when a certain fraction of others have adopted
- 'Others' may be everyone in a population, an individual's close friends, any reference group.
- Response can be probabilistic or deterministic.
- Individual thresholds can vary
- Assumption: order of others' adoption does not matter... (unrealistic).
- Assumption: level of influence per person is uniform (unrealistic).

Social Contagion Models Background Granovetter's model Network version Groups

References

# **Social Contagion**

# Some possible origins of thresholds:

- Desire to coordinate, to conform.
- Lack of information: impute the worth of a good or behavior based on degree of adoption (social proof)
- Economics: Network effects or network externalities
- Externalities = Effects on others not directly involved in a transaction
- Examples: telephones, fax machine, Facebook, operating systems
- An individual's utility increases with the adoption level among peers and the population in general

Social Contagion Models Background Granovetter's model Network version Groups

References

Frame 25/89

### Granovetter's Threshold model—definitions

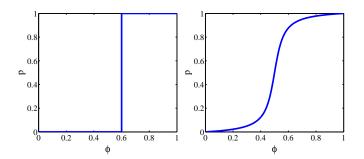

- $\phi^*$  = threshold of an individual.
- $f(\phi_*)$  = distribution of thresholds in a population.
- ►  $F(\phi_*)$  = cumulative distribution =  $\int_{\phi'_*=0}^{\phi_*} f(\phi'_*) d\phi'_*$
- $\phi_t$  = fraction of people 'rioting' at time step t.

Social Contagion Models Background Granovetter's model Network version Groups

References

Frame 27/89

- Example threshold influence response functions:
   deterministic and stochastic
- $\phi$  = fraction of contacts 'on' (e.g., rioting)
- ► Two states: S and I.

Social Contagion Models Background Granovetter's model Network version Groups

References

▶ At time t + 1, fraction rioting = fraction with  $\phi_* \leq \phi_t$ .

**•** 

$$\phi_{t+1} = \int_0^{\phi_t} f(\phi_*) d\phi_* = F(\phi_*)|_0^{\phi_t} = F(\phi_t)$$

ightharpoonup  $\Rightarrow$  Iterative maps of the unit interval [0, 1].

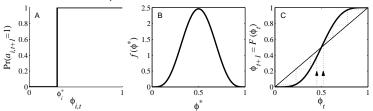

Social Contagion Models Background Granovetter's model Network version

References

Frame 29/89

Action based on perceived behavior of others.

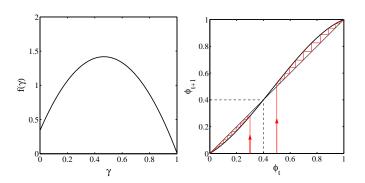

- Two states: S and I.
- $\phi$  = fraction of contacts 'on' (e.g., rioting)
- Discrete time update (strong assumption!)
- This is a Critical mass model

Social Contagion Models Background Granovetter's model Network version Groups

References

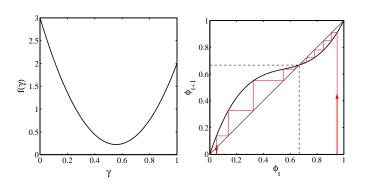

Another example of critical mass model...

References

Frame 32/89

References

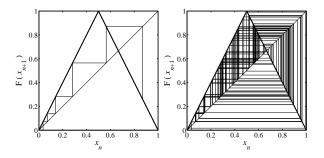

# Implications for collective action theory:

- 1. Collective uniformity ≠ individual uniformity
- 2. Small individual changes  $\Rightarrow$  large global changes

Frame 33/89

# Chaotic behavior possible [11, 10]

- Period doubling arises as map amplitude r is increased.
- Synchronous update assumption is crucial

Social Contagion Models Background Granovetter's model Network version Groups Chaos

References

Many years after Granovetter and Soong's work:

"A simple model of global cascades on random networks" D. J. Watts. Proc. Natl. Acad. Sci., 2002<sup>[19]</sup>

- Mean field model → network model
- Individuals now have a limited view of the world

Frame 36/89

# Threshold model on a network

- Interactions between individuals now represented by a network
- Network is sparse
- Individual i has k<sub>i</sub> contacts
- Influence on each link is reciprocal and of unit weight
- **Each** individual *i* has a fixed threshold  $\phi_i$
- Individuals repeatedly poll contacts on network
- Synchronous, discrete time updating
- ▶ Individual *i* becomes active when fraction of active contacts  $a_i \ge \phi_i k_i$
- Individuals remain active when switched (no recovery = SI model)

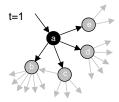

Social Contagion Models Background Granovetter's model Network version Groups

References

Frame 37/89

# Threshold model on a network

▶ All nodes have threshold  $\phi = 0.2$ .

### Social Contagion

Social Contagion Models Network version

References

Frame 38/89

# Snowballing

### The Cascade Condition:

If one individual is initially activated, what is the probability that an activation will spread over a network?

What features of a network determine whether a cascade will occur or not?

Social Contagion Models Network version

References

Frame 39/89

# Snowballing

# First study random networks:

- Start with N nodes with a degree distribution p<sub>k</sub>
- Nodes are randomly connected (carefully so)
- Aim: Figure out when activation will propagate
- Determine a cascade condition

# Social Contagion Models Network version

References

Frame 40/89

# Snowballing

#### Follow active links

- An active link is a link connected to an activated node.
- If an infected link leads to at least 1 more infected link, then activation spreads.
- We need to understand which nodes can be activated when only one of their neigbors becomes active.

Social Contagion Models Network version

References

Frame 41/89

# The most gullible

#### Vulnerables:

- We call individuals who can be activated by just one contact being active vulnerables
- ▶ The vulnerability condition for node *i*:

$$1/k_i \geq \phi_i$$

- ▶ Which means # contacts  $k_i \leq \lfloor 1/\phi_i \rfloor$
- For global cascades on random networks, must have a global cluster of vulnerables [19]
- Cluster of vulnerables = critical mass
- Network story: 1 node → critical mass → everyone.

Social Contagion Models Background Granovetter's model Network version Groups

References

#### Back to following a link:

- ▶ Link from leads to a node with probability  $\propto kP_k$ .
- ► Follows from links being random + having *k* chances to connect to a node with degree *k*.
- Normalization:

$$\sum_{k=0}^{\infty} k P_k = \langle k \rangle = z$$

► So

$$P(\text{linked node has degree } k) = \frac{kP_k}{\langle k \rangle}$$

Social Contagion Models Background Granovetter's model Network version Groups

References

Frame 43/89

# Next: Vulnerability of linked node

Linked node is vulnerable with probability

$$\beta_k = \int_{\phi'_*=0}^{1/k} f(\phi'_*) \mathrm{d}\phi'_*$$

- ► If linked node is vulnerable, it produces k 1 new outgoing active links
- If linked node is not vulnerable, it produces no active links.

Social Contagion Models Background Granovetter's model Network version Groups

References

Frame 44/89

#### Putting things together:

Expected number of active edges produced by an active edge =

$$\sum_{k=1}^{\infty} \underbrace{(k-1)\beta_k \frac{kP_k}{z}}_{\text{success}} + \underbrace{0(1-\beta_k)\frac{kP_k}{z}}_{\text{failure}}$$

$$=\sum_{k=1}^{\infty}(k-1)k\beta_kP_k/z$$

Social Contagion Models Background Granovetter's model

References

Network version

Frame 45/89

So... for random networks with fixed degree distributions, cacades take off when:

$$\sum_{k=1}^{\infty} k(k-1)\beta_k P_k/z \ge 1.$$

- $\triangleright$   $\beta_k$  = probability a degree k node is vulnerable.
- $ightharpoonup P_k = \text{probability a node has degree } k.$

Social Contagion Models Network version

References

Frame 46/89

#### Two special cases:

▶ (1) Simple disease-like spreading succeeds:  $\beta_k = \beta$ 

$$\beta \sum_{k=1}^{\infty} k(k-1) P_k / z \ge 1.$$

▶ (2) Giant component exists:  $\beta = 1$ 

$$\sum_{k=1}^{\infty} k(k-1)P_k/z \ge 1.$$

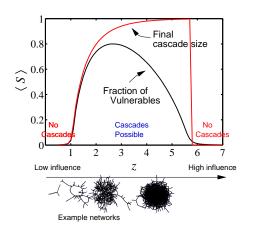

#### Social Contagion Models Background Granovetter's model Network version

References

Frame 47/89

#### Cascades on random networks

- Cascades occur only if size of max vulnerable cluster
   0.
- System may be 'robust-yet-fragile'.
- 'Ignorance' facilitates spreading.

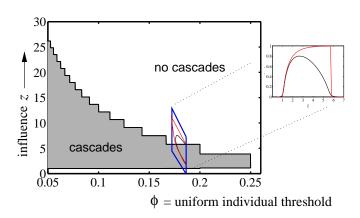

#### Social Contagion Models Background Granovetter's model Network version

References

Frame 48/89

#### Cascade window for random networks

- 'Cascade window' widens as threshold  $\phi$  decreases.
- Lower thresholds enable spreading.

Frame 65/89

T TOTOTOTICE

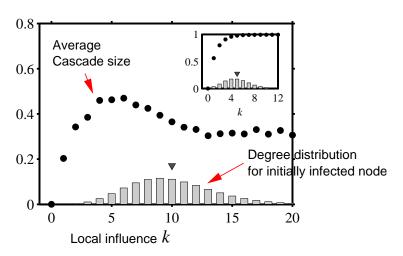

Multiplier almost always below 1.

Frame 66/89

# Assortativity in group-based networks

- The most connected nodes aren't always the most 'influential.'
- Degree assortativity is the reason.

Social Contagion Models Background Granovetter's model Network version Groups

References

Frame 67/89

# Social contagion

#### Summary

- 'Influential vulnerables' are key to spread.
- Early adopters are mostly vulnerables.
- Vulnerable nodes important but not necessary.
- Groups may greatly facilitate spread.
- Seems that cascade condition is a global one.
- Most extreme/unexpected cascades occur in highly connected networks
- 'Influentials' are posterior constructs.
- Many potential influentials exist.

Social Contagion Models Groups

References

# Social contagion

# **Implications**

- Focus on the influential vulnerables.
- Create entities that can be transmitted successfully through many individuals rather than broadcast from one 'influential.'
- Only simple ideas can spread by word-of-mouth.
   (Idea of opinion leaders spreads well...)
- Want enough individuals who will adopt and display.
- ▶ Displaying can be passive = free (yo-yo's, fashion), or active = harder to achieve (political messages).
- Entities can be novel or designed to combine with others, e.g. block another one.

Social Contagion Models Background Granovetter's model Network version Groups

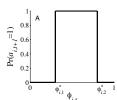

References

Frame 69/89

# Chaotic contagion:

- What if individual response functions are not monotonic?
- Consider a simple deterministic version:
- Node i has an 'activation threshold' φ<sub>i,1</sub>
   ... and a 'de-activation threshold' φ<sub>i,2</sub>
- Nodes like to imitate but only up to a limit—they don't want to be like everyone else.

Social Contagion Models Background Granovetter's model Network version Groups

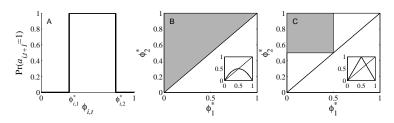

References

Chaos

Frame 71/89

# Two population examples:

- ▶ Randomly select  $(\phi_{i,1}, \phi_{i,2})$  from gray regions shown in plots B and C.
- Insets show composite response function averaged over population.
- We'll consider plot C's example: the tent map.

Social Contagion Models Background Granovetter's model Network version Groups Chaos

References

# Chaotic contagion

#### Definition of the tent map:

$$F(x) = \begin{cases} rx \text{ for } 0 \le x \le \frac{1}{2}, \\ r(1-x) \text{ for } \frac{1}{2} \le x \le 1. \end{cases}$$

► The usual business: look at how *F* iteratively maps the unit interval [0, 1].

References

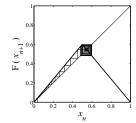

Chaos

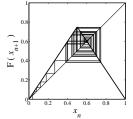

Frame 73/89

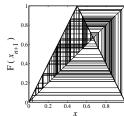

# The tent map

#### Effect of increasing r from 1 to 2.

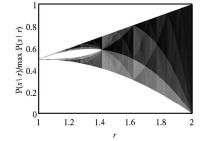

References

# Orbit diagram:

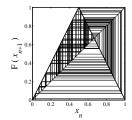

Chaotic behavior increases as map slope *r* is increased.

Frame 74/89

## Chaotic behavior

#### Take r = 2 case:

- What happens if nodes have limited information?
- As before, allow interactions to take place on a sparse random network.
- ▶ Vary average degree  $z = \langle k \rangle$ , a measure of information

#### Stochastic response functions:

Social Contagion Models Background Granovetter's model Network version Groups

References

Chaos

Frame 81/89

60

## Coupled maps are well explored (Kaneko/Kuramoto):

$$x_{i,n+1} = f(x_{i,n}) + \sum_{j \in \mathcal{N}_i} \delta_{i,j} f(x_{j,n})$$

- $\triangleright \mathcal{N}_i$  = neighborhood of node i
- 1. Node states are continuous
- 2. Increase  $\delta$  and neighborhood size  $|\mathcal{N}|$

 $\Rightarrow$  synchronization

#### But for contagion model:

- Node states are binary
- 2. Asynchrony remains as connectivity increases
