# Independent Interaction models

## Differential equations for continuous model

$$\frac{d}{dt}S = -\beta IS + \rho R$$

$$\frac{d}{dt}I = \beta IS - rI$$

$$\frac{d}{dt}R = rI - \rho R$$

$\beta$ ,  $r$ , and  $\rho$  are now **rates**.

## Reproduction Number $R_0$ :

- \*  $R_0$  = expected number of infected individuals resulting from a single initial infective
- \* Epidemic threshold: if  $R_0 > 1$ , 'epidemic' occurs.

# Independent Interaction models

## Differential equations for continuous model

$$\frac{d}{dt}S = -\beta IS + \rho R$$

$$\frac{d}{dt}I = \beta IS - rI$$

$$\frac{d}{dt}R = rI - \rho R$$

$\beta$ ,  $r$ , and  $\rho$  are now **rates**.

## Reproduction Number $R_0$ :

- ▶  $R_0$  = expected number of infected individuals resulting from a single initial infective
- ▶ Epidemic threshold: If  $R_0 > 1$ , 'epidemic' occurs.

# Independent Interaction models

## Differential equations for continuous model

$$\frac{d}{dt}S = -\beta IS + \rho R$$

$$\frac{d}{dt}I = \beta IS - rI$$

$$\frac{d}{dt}R = rI - \rho R$$

$\beta$ ,  $r$ , and  $\rho$  are now **rates**.

## Reproduction Number $R_0$ :

- ▶  $R_0$  = expected number of infected individuals resulting from a single initial infective
- ▶ Epidemic threshold: If  $R_0 > 1$ , 'epidemic' occurs.

- ▶ At time  $t = k$ , single Infective remains infected with probability  $(1 - r)^k$

# Reproduction Number $R_0$

## Discrete version:

- ▶ Expected number infected by original Infective:

$$R_0 = \beta + (1 - r)\beta + (1 - r)^2\beta + (1 - r)^3\beta + \dots$$

# Reproduction Number $R_0$

## Discrete version:

- ▶ Expected number infected by original Infective:

$$R_0 = \beta + (1 - r)\beta + (1 - r)^2\beta + (1 - r)^3\beta + \dots$$

$$= \beta \left( 1 + (1 - r) + (1 - r)^2 + (1 - r)^3 + \dots \right)$$

# Reproduction Number $R_0$

## Discrete version:

- ▶ Expected number infected by original Infective:

$$R_0 = \beta + (1 - r)\beta + (1 - r)^2\beta + (1 - r)^3\beta + \dots$$

$$= \beta \left( 1 + (1 - r) + (1 - r)^2 + (1 - r)^3 + \dots \right)$$

$$= \beta \frac{1}{1 - (1 - r)}$$

# Reproduction Number $R_0$

## Discrete version:

- ▶ Expected number infected by original Infective:

$$R_0 = \beta + (1 - r)\beta + (1 - r)^2\beta + (1 - r)^3\beta + \dots$$

$$= \beta \left( 1 + (1 - r) + (1 - r)^2 + (1 - r)^3 + \dots \right)$$

$$= \beta \frac{1}{1 - (1 - r)} = \beta/r$$

# Reproduction Number $R_0$

## Discrete version:

- ▶ Expected number infected by original Infective:

$$R_0 = \beta + (1 - r)\beta + (1 - r)^2\beta + (1 - r)^3\beta + \dots$$

$$= \beta \left( 1 + (1 - r) + (1 - r)^2 + (1 - r)^3 + \dots \right)$$

$$= \beta \frac{1}{1 - (1 - r)} = \beta/r$$

For  $S_0$  initial infectives ( $1 - S_0 = R_0$  immune):

$$R_0 = S_0\beta/r$$

# Independent Interaction models

## For the continuous version

- ▶ Second equation:

$$\frac{d}{dt}I = \beta SI - rI$$

- ▶ Number of infectives grows initially if

$$\beta S(0) - r > 0$$

- ▶ Same story as for discrete model.

# Independent Interaction models

## For the continuous version

- ▶ Second equation:

$$\frac{d}{dt}I = \beta SI - rI$$

$$\frac{d}{dt}I = (\beta S - r)I$$

- ▶ Number of infectives grows initially if

$$\beta S(0) - r > 0$$

- ▶ Same story as for discrete model.

# Independent Interaction models

## For the continuous version

- ▶ Second equation:

$$\frac{d}{dt}I = \beta SI - rI$$

$$\frac{d}{dt}I = (\beta S - r)I$$

- ▶ Number of infectives grows initially if

$$\beta S(0) - r > 0$$

- ▶ Same story as for discrete model.

# Independent Interaction models

# Disease spreading models

## For novel diseases:

1. Can we predict the size of an epidemic?
2. How important is the reproduction number  $R_0$ ?

# Disease spreading models

For novel diseases:

1. Can we predict the size of an epidemic?
2. How important is the reproduction number  $R_0$ ?

# Disease spreading models

For novel diseases:

1. Can we predict the size of an epidemic?
2. How important is the reproduction number  $R_0$ ?

# $R_0$ and variation in epidemic sizes

$R_0$  approximately same for all of the following:

- ▶ 1918-19 “Spanish Flu” ~ 500,000 deaths in US
- ▶ 1957-58 “Asian Flu” ~ 70,000 deaths in US
- ▶ 1968-69 “Hong Kong Flu” ~ 34,000 deaths in US
- ▶ 2003 “SARS Epidemic” ~ 800 deaths world-wide

# $R_0$ and variation in epidemic sizes

$R_0$  approximately same for all of the following:

- ▶ 1918-19 “Spanish Flu” ~ 500,000 deaths in US
- ▶ 1957-58 “Asian Flu” ~ 70,000 deaths in US
- ▶ 1968-69 “Hong Kong Flu” ~ 34,000 deaths in US

# The challenge

So... can a simple model produce

1. **broad epidemic distributions**  
and
2. **resurgence ?**

# Size distributions

Simple models typically produce **bimodal** or **unimodal** size distributions.

- ▶ This **includes** network models:  
random, small-world, scale-free, ...
- ▶ Exceptions:
  1. Forest-fire models
  2. Sophisticated metapopulation models

# Conclusions

- ▶ For this model, epidemic size is highly unpredictable
- ▶ Model is more complicated than SIR but still simple
- ▶ We haven't even included normal social responses such as travel bans and self-quarantine.
- ▶ The reproduction number  $R_0$  is not terribly useful.
- ▶  $R_0$ , however measured, is not informative about
  - 1. how likely the observed epidemic size was,
  - 2. and how likely future epidemics will be.
- ▶ Problem:  $R_0$  summarises **one** epidemic after the fact and enfold movement, the price of bananas, everything.

# Conclusions

# Conclusions

- ▶ Disease spread highly sensitive to population structure
- ▶ Rare events may matter enormously
- ▶ More support for controlling population movement

# Conclusions

- ▶ Disease spread highly sensitive to population structure
- ▶ Rare events may matter enormously
- ▶ More support for controlling population movement

# Conclusions

- ▶ Disease spread highly sensitive to population structure
- ▶ Rare events may matter enormously (e.g., an infected individual taking an international flight)
- ▶ More support for controlling population movement

# Conclusions

- ▶ Disease spread highly sensitive to population structure
- ▶ Rare events may matter enormously (e.g., an infected individual taking an international flight)
- ▶ More support for controlling population movement

# Conclusions

- ▶ Disease spread highly sensitive to population structure
- ▶ Rare events may matter enormously (e.g., an infected individual taking an international flight)
- ▶ More support for controlling population movement (e.g., travel advisories, quarantine)

# Conclusions

## What to do:

- ▶ Need to separate movement from disease
- ▶  $R_0$  needs a friend or two.
- ▶ Need  $R_0 > 1$  and  $P_0 > 1$  and  $\xi$  sufficiently large for disease to have a chance of spreading

## More wondering:

- ▶ Exactly how important are rare events in disease spreading?
- ▶ Again, what is  $N^*$ ?

# Conclusions

## What to do:

- ▶ Need to separate movement from disease

# Economics, Schmeconomics

James K. Galbraith:

NYT But there are at least 15,000 professional economists in this country, and you're saying only two or three of them foresaw the mortgage crisis?  
[JKG] Ten or 12 would be closer than two or three.

NYT What does that say about the field of economics, which claims to be a science?

From the New York Times, 11/02/2008 (田)
