# Generalized contagion model

### Basic questions about contagion

- How many types of contagion are there?
- How can we categorize real-world contagions?
- Can we connect models of disease-like and social contagion?
- Focus: mean field models.

### The standard SIR model [10]

- = basic model of disease contagion
- ► Three states:
  - 1. S = Susceptible
  - 2. I = Infective/Infectious
  - 3. R = Recovered or Removed or Refractory
- S(t) + I(t) + R(t) = 1
- Presumes random interactions (mass-action principle)
- Interactions are independent (no memory)
- Discrete and continuous time versions

# Independent Interaction models

### Differential equations for continuous model

$$\frac{d}{dt}S = -\beta IS + \rho R$$

$$\frac{d}{dt}I = \beta IS - rI$$

$$\frac{d}{dt}R = rI - \rho R$$

 $\beta$ , r, and  $\rho$  are now rates.

### Reproduction Number $R_0$ :

- R<sub>0</sub> = expected number of infected individuals resulting from a single initial infective
- ▶ Epidemic threshold: If  $R_0 > 1$ , 'epidemic' occurs.

#### Generalized Contagion

Introduction

### Independent Interac

Interdependent interaction models

### Homogeneous version

Homogeneous version
Heterogeneous version

### Appendix

# Reproduction Number R<sub>0</sub>

### Discrete version:

- Set up: One Infective in a randomly mixing population of Susceptibles
- At time *t* = 0, single infective random bumps into a Susceptible
- ▶ Probability of transmission =  $\beta$
- At time t = 1, single Infective remains infected with probability 1 − r
- At time t = k, single Infective remains infected with probability  $(1 r)^k$

Generalized Contagion

Introduction

Independent Interac

Interdependent interaction models

Generalized Model

Homogeneous version
Heterogeneous version

Appendix

# Reproduction Number Ro

### Discrete version:

Expected number infected by original Infective:

$$R_0 = \beta + (1-r)\beta + (1-r)^2\beta + (1-r)^3\beta + \dots$$

$$= \beta \left( 1 + (1-r) + (1-r)^2 + (1-r)^3 + \ldots \right)$$

$$=\beta\frac{1}{1-(1-r)}=\beta/r$$

Similar story for continuous model.

# Some (of many) issues

- Disease models assume independence of infectious events.
- Threshold models only involve proportions:  $3/10 \equiv 30/100$ .
- Threshold models ignore exact sequence of influences
- Threshold models assume immediate polling.
- Mean-field models neglect network structure
- Network effects only part of story: media, advertising, direct marketing.

#### Generalized Contagion

Introduction

Independent Interaction models

### Interdependent inter

Generalized Model
Homogeneous version
Heterogeneous version

Appendix

### Generalized model

### Basic ingredients:

- Incorporate memory of a contagious element [4, 5]
- Population of N individuals, each in state S, I, or R.
- Each individual randomly contacts another at each time step.
- $\phi_t$  = fraction infected at time t = probability of contact with infected individual
- With probability p, contact with infective leads to an exposure.
- If exposed, individual receives a dose of size d drawn from distribution f. Otherwise d = 0.

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

### Generalized Model

Heterogeneous ve

Appendix

# Generalized model—ingredients

▶ Individuals 'remember' last *T* contacts:

$$D_{t,i} = \sum_{t'=t-T+1}^t d_i(t')$$

► Infection occurs if individual i's 'threshold' is exceeded:

$$D_{t,i} \geq d_i^*$$

Threshold  $d_i^*$  drawn from arbitrary distribution g at t = 0.

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

### Generalized Model Homogeneous version

Heterogeneous version

Appendix

# Generalized model—ingredients

When  $D_{t,i} < d_i^*$ , individual i recovers to state R with probability r.

 $R \Rightarrow S$ 

Once in state R, individuals become susceptible again with probability  $\rho$ .

#### Generalized Contagion

Independent Interaction models

Interdependent interaction models

### Generalized Model

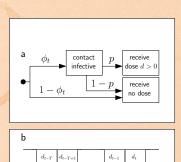

Homogeneous version

**Appendix** 

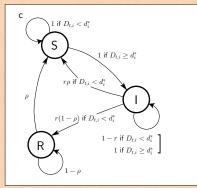

# A visual explanation

 $\sum = D_{t,i}$ 

#### Generalized Contagion

Independent Interaction models

interaction models

### Generalized Model

**Appendix** 

### Generalized mean-field model

### Study SIS-type contagion first:

Recovered individuals are immediately susceptible again:

$$r = \rho = 1$$
.

- Look for steady-state behavior as a function of exposure probability p.
- ▶ Denote fixed points by  $\phi^*$ .

### Homogeneous version:

- All individuals have threshold d\*
- ► All dose sizes are equal: d = 1

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

### Generalized Model

Heterogeneous version

Appendix

### Fixed points for r < 1, $d^* = 1$ , and T = 1:

- r < 1 means recovery is probabilistic.
- T = 1 means individuals forget past interactions.
- $d^* = 1$  means one positive interaction will infect an individual.
- Evolution of infection level:

$$\phi_{t+1} = \underbrace{p\phi_t}_{\mathbf{a}} + \underbrace{\phi_t(1-p\phi_t)}_{\mathbf{b}} \underbrace{(1-r)}_{\mathbf{c}}.$$

- a: Fraction infected between t and t + 1, independent of past state or recovery.
- b: Probability of being infected and not being reinfected.
- c: Probability of not recovering.

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

Generalized Model

Homogeneous version
Heterogeneous version

Appendix

### Fixed points for r < 1, $d^* = 1$ , and T = 1:

Set  $\phi_t = \phi^*$ :

$$\phi^* = p\phi^* + (1 - p\phi^*)\phi^*(1 - r)$$

$$\Rightarrow 1 = p + (1 - p\phi^*)(1 - r), \quad \phi^* \neq 0,$$

$$\Rightarrow \phi^* = \frac{1 - r/p}{1 - r}$$
 and  $\phi^* = 0$ .

- Critical point at  $p = p_c = r$ .
- ▶ Spreading takes off if p/r > 1
- Find continuous phase transition as for SIR model.
- ▶ Goodness: Matches  $R_o = \beta/\gamma > 1$  condition.

#### Generalized Contagion

Independent Interaction models

Interdependent interaction models

Generalized Model

Homogeneous version
Heterogeneous version

Appendix

neierences

# Simple homogeneous examples

### Fixed points for r = 1, $d^* = 1$ , and T > 1

- ightharpoonup r = 1 means recovery is immediate.
- T > 1 means individuals remember at least 2 interactions.
- d\* = 1 means only one positive interaction in past T interactions will infect individual.
- Effect of individual interactions is independent from effect of others.
- Call φ\* the steady state level of infection.
- Pr(infected) = 1 Pr(uninfected):

$$\phi^* = 1 - (1 - p\phi^*)^T$$
.

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

Generalized Model

Heterogeneous version

Appendix

Fixed points for r = 1,  $d^* = 1$ , and T > 1

▶ Closed form expression for  $\phi^*$ :

$$\phi^* = 1 - (1 - p\phi^*)^T$$
.

- Look for critical infection probability  $p_c$ .
- As  $\phi^* \rightarrow 0$ , we see

$$\phi^* \simeq \rho T \phi^* \quad \Rightarrow \rho_c = 1/T.$$

- Again find continuous phase transition...
- Note: we can solve for p but not  $\phi^*$ :

$$p = (\phi^*)^{-1}[1 - (1 - \phi^*)^{1/T}].$$

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

Generalized Model

Homogeneous version
Heterogeneous version

Appendix

### Fixed points for $r \le 1$ , $d^* = 1$ , and $T \ge 1$

Start with r = 1,  $d^* = 1$ , and  $T \ge 1$  case we have just examined:

$$\phi^* = 1 - (1 - p\phi^*)^T$$
.

- For *r* < 1, add to right hand side fraction who:
  - 1. Did not receive any infections in last T time steps,
  - 2. And did not recover from a previous infection.
- Define corresponding dose histories. Example:

$$H_1 = \{\dots, d_{t-T-2}, d_{t-T-1}, 1, \underbrace{0, 0, \dots, 0, 0}_{T \text{ 0's}}\},\$$

With history  $H_1$ , probability of being infected (not recovering in one time step) is 1 - r.

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

### Generalized Model

Homogeneous version
Heterogeneous version

Appendix

### Fixed points for $r \le 1$ , $d^* = 1$ , and $T \ge 1$

In general, relevant dose histories are:

$$H_{m+1} = \{\dots, d_{t-T-m-1}, 1, \underbrace{0, 0, \dots, 0, 0}_{m \text{ 0's}}, \underbrace{0, 0, \dots, 0, 0}_{T \text{ 0's}}\}.$$

Overall probabilities for dose histories occurring:

$$P(H_1) = p\phi^*(1 - p\phi^*)^T(1 - r),$$

$$P(H_{m+1}) = \underbrace{p\phi^*}_{a} \underbrace{(1-p\phi^*)^{T+m}}_{b} \underbrace{(1-r)^{m+1}}_{c}.$$

- a: Pr(infection T + m + 1 time steps ago)
- b: Pr(no doses received in T + m time steps since)
- c: Pr(no recovery in *m* chances)

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

Generalized Model
Homogeneous version

Heterogeneous version

Appendix

### Fixed points for $r \le 1$ , $d^* = 1$ , and $T \ge 1$

Pr(recovery) = Pr(seeing no doses for at least T time steps and recovering)

$$= r \sum_{m=0}^{\infty} P(H_{T+m}) = r \sum_{m=0}^{\infty} p \phi^* (1 - p \phi^*)^{T+m} (1 - r)^m$$
$$= r \frac{p \phi^* (1 - p \phi^*)^T}{1 - (1 - p \phi^*)(1 - r)}.$$

Fixed point equation:

$$\phi^* = 1 - \frac{r(1 - p\phi^*)^T}{1 - (1 - p\phi^*)(1 - r)}.$$

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

### Generalized Model

Homogeneous version
Heterogeneous version

Appendix

### Fixed points for $r \le 1$ , $d^* = 1$ , and $T \ge 1$

Fixed point equation (again):

$$\phi^* = 1 - \frac{r(1 - p\phi^*)^T}{1 - (1 - p\phi^*)(1 - r)}.$$

▶ Find critical exposure probability by examining above as  $\phi^* \rightarrow 0$ .

.

$$\Rightarrow p_c = \frac{1}{T+1/r-1} = \frac{1}{T+\tau}.$$

where  $\tau$  = mean recovery time for simple relaxation process.

Decreasing r keeps individuals infected for longer and decreases  $p_c$ .

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

Generalized Model

Heterogeneous version

Appendix

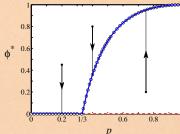

## **Epidemic threshold:**

Fixed points for  $d^* = 1$ ,  $r \le 1$ , and  $T \ge 1$ 

$$\phi^* = 1 - \frac{r(1-p\phi^*)^T}{1-(1-p\phi^*)(1-r)}$$

$$\phi^* = 0$$

$$p_c = 1/(T+\tau)$$

- ► Example details:  $T = 2 \& r = 1/2 \Rightarrow p_c = 1/3$ .
- ► Blue = stable, red = unstable, fixed points.
- $\tau = 1/r 1$  = characteristic recovery time = 1.
- ►  $T + \tau \simeq$  average memory in system = 3.
- Phase transition can be seen as a transcritical bifurcation. [11]

Homogeneous version

Appendix

# Fixed points for r = 1, $d^* > 1$ , and $T \ge 1$

▶ Bifurcation points for example fixed T, varying d\*:

# ► *T* = 96 (△).

► 
$$T = 12 (\triangleleft),$$

$$T = 6 (\square),$$

▶ 
$$T = 3 ( ),$$

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

#### Generalized Model

Heterogeneous version

### Appendix

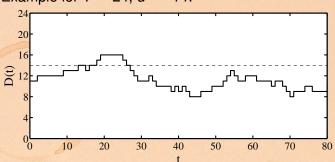

# Fixed points for r < 1, $d^* > 1$ , and $T \ge 1$

- For r < 1, need to determine probability of recovering as a function of time since dose load last dropped below threshold.
- Partially summed random walks:

$$D_i(t) = \sum_{t'=t-T+1}^t d_i(t')$$

• Example for T = 24,  $d^* = 14$ :

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

Generalized Model

Homogeneous version
Heterogeneous version

Appendix

# Fixed points for r < 1, $d^* > 1$ , and $T \ge 1$

- Define  $\gamma_m$  as fraction of individuals for whom D(t) last equaled, and his since been below, their threshold m time steps ago,
- Fraction of individuals below threshold but not recovered:

$$\Gamma(p,\phi^*;r)=\sum_{m=1}^{\infty}(1-r)^m\gamma_m(p,\phi^*).$$

Fixed point equation:

$$\phi^* = \Gamma(p, \phi^*; r) + \sum_{i=d^*}^T {T \choose i} (p\phi^*)^i (1 - p\phi^*)^{T-i}.$$

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

Generalized Model

Homogeneous version

Appendix

# Fixed points for r < 1, $d^* > 1$ , and $T \ge 1$ Example: T = 3, $d^* = 2$

Want to examine how dose load can drop below threshold of  $d^* = 2$ :

$$D_n = 2 \Rightarrow D_{n+1} = 1$$

► Two subsequences do this:

$$\{d_{n-2}, d_{n-1}, d_n, d_{n+1}\} = \{1, 1, 0, 0\}$$
  
and  $\{d_{n-2}, d_{n-1}, d_n, d_{n+1}, d_{n+2}\} = \{1, 0, 1, 0, 0\}.$ 

- Note: second sequence includes an extra 0 since this is necessary to stay below  $d^* = 2$ .
- To stay below threshold, observe acceptable following sequences may be composed of any combination of two subsequences:

$$a = \{0\}$$
 and  $b = \{1, 0, 0\}$ .

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

### Generalized Model

Homogeneous version

#### Appendix

# Fixed points for r < 1, $d^* > 1$ , and $T \ge 1$

- ▶ Determine number of sequences of length m that keep dose load below  $d^* = 2$ .
- $ightharpoonup N_a$  = number of  $a = \{0\}$  subsequences.
- ▶  $N_b$  = number of  $b = \{1, 0, 0\}$  subsequences.

$$m = N_a \cdot 1 + N_b \cdot 3$$

Possible values for  $N_b$ :

$$0,1,2,\ldots,\left\lfloor\frac{m}{3}\right\rfloor.$$

where [.] means floor.

Corresponding possible values for N<sub>a</sub>:

$$m, m-3, m-6, \ldots, m-3 \left| \frac{m}{3} \right|$$
.

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

Generalized Model

Homogeneous version
Heterogeneous version

Appendix

- ► How many ways to arrange N<sub>a</sub> a's and N<sub>b</sub> b's?
- Think of overall sequence in terms of subsequences:

$$\{Z_1, Z_2, \ldots, Z_{N_a+N_b}\}$$

- $ightharpoonup N_a + N_b$  slots for subsequences.
- Choose positions of either a's or b's:

$$\binom{N_a+N_b}{N_a}=\binom{N_a+N_b}{N_b}.$$

#### Generalized Contagion

Introduction

Independent Interaction models

Interdependent interaction models

Generalized Model

Homogeneous version

Appendix

► Total number of allowable sequences of length *m*:

$$\sum_{N_b=0}^{\lfloor m/3\rfloor} \binom{N_b+N_a}{N_b} = \sum_{k=0}^{\lfloor m/3\rfloor} \binom{m-2k}{k}$$

where  $k = N_b$  and we have used  $m = N_a + 3N_b$ .

- $P(a) = (1 p\phi^*)$  and  $P(b) = p\phi^*(1 p\phi^*)^2$
- ► Total probability of allowable sequences of length *m*:

$$\chi_m(p,\phi^*) = \sum_{k=0}^{\lfloor m/3 \rfloor} {m-2k \choose k} (1-p\phi^*)^{m-k} (p\phi^*)^k.$$

Notation: Write a randomly chosen sequence of a's and b's of length m as  $D_m^{a,b}$ .

#### Generalized Contagion

Heterogeneous version

Appendix

# Generalized model—heterogeneity, r = 1

Fixed point equation:

$$\phi^* = \sum_{k=1}^{T} {T \choose k} (p\phi^*)^k (1 - p\phi^*)^{T-k} \underline{\underline{P_k}}$$

Expand around  $\phi^* = 0$  to find when spread from single seed is possible:

$$pP_1T \ge 1$$
 or  $\Rightarrow p_c = 1/(TP_1)$ 

- Very good:
  - 1. *P*<sub>1</sub>*T* is the expected number of vulnerables the initial infected individual meets before recovering.
  - 2.  $pP_1T$  is : the expected number of successful infections (equivalent to  $R_0$ ).
- Observe: p<sub>c</sub> may exceed 1 meaning no spreading from a small seed.

# Heterogeneous case

- Next: Determine slope of fixed point curve at critical point  $p_c$ .
- Expand fixed point equation around  $(p, \phi^*) = (p_c, 0)$ .
- Find slope depends on  $(P_1 P_2/2)^{[5]}$  (see appendix).
- Behavior near fixed point depends on whether this slope is
  - 1. positive:  $P_1 > P_2/2$  (continuous phase transition)
  - 2. negative:  $P_1 < P_2/2$  (discontinuous phase transition)
- Now find three basic universal classes of contagion models...

### Example configuration:

- Dose sizes are lognormally distributed with mean 1 and variance 0.433.
- Memory span: T = 10.
- ► Thresholds are uniformly set at
  - 1.  $d_* = 0.5$
  - 2.  $d_* = 1.6$
  - 3.  $d_* = 3$
- Spread of dose sizes matters, details are not important.

### Three universal classes

Epidemic threshold:

$$P_1 > P_2/2, p_c = 1/(TP_1) < 1$$

► Vanishing critical mass:

$$P_1 < P_2/2, p_c = 1/(TP_1) < 1$$

Pure critical mass:

$$P_1 < P_2/2, \, p_c = 1/(\textit{TP}_1) > 1$$

# Heterogeneous case

# Now allow r < 1:

- II-III transition generalizes:  $p_c = 1/[P_1(T + \tau)]$  where  $\tau = 1/r 1$  = expected recovery time
- I-II transition less pleasant analytically.

### Discussion

- Memory is a natural ingredient.
- Three universal classes of contagion processes:
  - 1. I. Epidemic Threshold
  - 2. II. Vanishing Critical Mass
  - 3. III. Critical Mass
- Dramatic changes in behavior possible.
- To change kind of model: 'adjust' memory, recovery, fraction of vulnerable individuals (T, r, ρ, P<sub>1</sub>, and/or P<sub>2</sub>).
- To change behavior given model: 'adjust' probability of exposure (p) and/or initial number infected  $(\phi_0)$ .

### Discussion

- ▶ Single seed infects others if  $pP_1(T + \tau) \ge 1$ .
- Key quantity:  $p_c = 1/[P_1(T+\tau)]$
- ▶ If  $p_c$  < 1 ⇒ contagion can spread from single seed.
- Depends only on:
  - 1. System Memory  $(T + \tau)$ .
  - 2. Fraction of highly vulnerable individuals  $(P_1)$ .
- ▶ Details unimportant: Many threshold and dose distributions give same P<sub>k</sub>.
- Another example of a model where vulnerable/gullible population may be more important than a small group of super-spreaders or influentials.

## Details for Class I-II transition:

$$\phi^* = \sum_{k=1}^{T} {T \choose k} P_k (p\phi^*)^k (1 - p\phi^*)^{T-k},$$

$$= \sum_{k=1}^{T} {T \choose k} P_k (p\phi^*)^k \sum_{j=0}^{T-k} {T - k \choose j} (-p\phi^*)^j,$$

$$= \sum_{k=1}^{T} \sum_{j=0}^{T-k} {T \choose k} {T - k \choose j} P_k (-1)^j (p\phi^*)^{k+j},$$

$$= \sum_{m=1}^{T} \sum_{k=1}^{m} {T \choose k} {T - k \choose j} P_k (-1)^{m-k} (p\phi^*)^m,$$

$$= \sum_{m=1}^{T} C_m (p\phi^*)^m$$

#### Generalized Contagion

Independent

interaction models

Appendix

### Details for Class I-II transition:

$$C_m = (-1)^m {T \choose m} \sum_{k=1}^m (-1)^k {m \choose k} P_k,$$

since

$$\begin{pmatrix} T \\ k \end{pmatrix} \begin{pmatrix} T - k \\ m - k \end{pmatrix} = \frac{T!}{k!(T - k)!} \frac{(T - k)!}{(m - k)!(T - m)!}$$

$$= \frac{T!}{m!(T - m)!} \frac{m!}{k!(m - k)!}$$

$$= \begin{pmatrix} T \\ m \end{pmatrix} \begin{pmatrix} m \\ k \end{pmatrix}.$$

Independent

interaction models

### **Appendix**

### Details for Class I-II transition:

Linearization gives

$$\phi^* \simeq C_1 \rho \phi^* + C_2 \rho_c^2 \phi^{*2}$$
.

where  $C_1 = TP_1(=1/p_c)$  and  $C_2 = {T \choose 2}(-2P_1 + P_2)$ .

▶ Using  $p_c = 1/(TP_1)$ :

$$\phi^* \simeq \frac{C_1}{C_2 \rho_c^2} (p - p_c) = \frac{T^2 P_1^3}{(T - 1)(P_1 - P_2/2)} (p - p_c).$$

▶ Sign of derivative governed by  $P_1 - P_2/2$ .
