Outline

- Basic definitions
- Examples of Complex Networks
- Properties of Complex Networks
- Nutshell
- Basic models of complex networks
 - Generalized random networks
 - Scale-free networks
 - Small-world networks
 - Generalized affiliation networks

References

net•work |'net,wɔrk|

noun

- 1 an arrangement of intersecting horizontal and vertical lines.
 - a complex system of roads, railroads, or other transportation routes : *a network of railroads.*
- 2 a group or system of interconnected people or things : *a trade network.*
 - a group of people who exchange information, contacts, and experience for professional or social purposes : *a support network.*
 - a group of broadcasting stations that connect for the simultaneous broadcast of a program : *the introduction of a second TV network* | [as adj.] *network television.*
 - a number of interconnected computers, machines, or operations : *specialized computers that manage multiple outside connections to a network* | *a local cellular phone network.*
 - a system of connected electrical conductors.

verb [trans.]

connect as or operate with a network : *the stock exchanges have proven to be resourceful in networking these deals.*

- link (machines, esp. computers) to operate interactively : [as adj.] (**networked**) *networked workstations.*
- [intrans.] [often as n.] (**networking**) interact with other people to exchange information and develop contacts, esp. to further one's career : *the skills of networking, bargaining, and negotiation.*

Thesaurus deliciousness:

network

noun

- 1 *a network of arteries* WEB, lattice, net, matrix, mesh, crisscross, grid, reticulum, reticulation; Anatomy plexus.
- 2 *a network of lanes* MAZE, labyrinth, warren, tangle.
- 3 *a network of friends* SYSTEM, complex, nexus, web, webwork.

Ancestry:

Net and Work are venerable old words:

- ▶ 'Net' first used to mean spider web (King Ælfréd, 888).
- ▶ 'Work' appear to have long meant purposeful action.

- ▶ 'Network' = something built based on the idea of natural, flexible lattice or web.
- ▶ c.f., ironwork, stonework, fretwork.

Key Observation:

- ▶ Many complex systems can be viewed as complex networks of physical or abstract interactions.
- ▶ Opens door to mathematical and numerical analysis.
- ▶ Dominant approach of last decade of a theoretical-physics/stat-mechish flavor.
- ▶ Mindboggling amount of work published on complex networks since 1998...
- ▶ ... largely due to your typical theoretical physicist:

- ▶ *Piranha physicus*
- ▶ Hunt in packs.
- ▶ Feast on new and interesting ideas (see chaos, cellular automata, ...)

Super Basic definitions

Nodes = A collection of entities which have properties that are somehow related to each other

- ▶ e.g., people, forks in rivers, proteins, webpages, organisms,...

Links = Connections between nodes

- ▶ **Links** may be directed or undirected.
- ▶ **Links** may be binary or weighted.

Other spiffing words: vertices and edges.

More observations

- ▶ But surely **networks aren't new**...
- ▶ Graph theory is well established...
- ▶ Study of social networks started in the 1930's...
- ▶ So why all this 'new' research on networks?
- ▶ **Answer: Oodles of Easily Accessible Data.**
- ▶ We can now inform (alas) our theories with a much more measurable reality.*
- ▶ A worthy goal: establish **mechanistic explanations**.

* If this is upsetting, maybe string theory is for you...

Super Basic definitions

Node degree = Number of links per node

- ▶ Notation: Node i 's degree = k_i .
- ▶ $k_i = 0, 1, 2, \dots$
- ▶ Notation: the average degree of a network = $\langle k \rangle$ (and sometimes z)
- ▶ Connection between number of edges m and average degree:

$$\langle k \rangle = \frac{2m}{N}$$

- ▶ **Defn:** \mathcal{N}_i = the set of i 's k_i neighbors

Super Basic definitions

Adjacency matrix:

- ▶ We represent a directed network by a matrix A with link weight a_{ij} for nodes i and j in entry (i, j) .

▶ e.g.,

$$A = \begin{bmatrix} 0 & 1 & 1 & 1 & 0 \\ 0 & 0 & 1 & 0 & 1 \\ 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 \end{bmatrix}$$

- ▶ (n.b., for numerical work, we always use sparse matrices.)

Examples

So what passes for a complex network?

- ▶ Complex networks are **large** (in node number)
- ▶ Complex networks are **sparse** (low edge to node ratio)
- ▶ Complex networks are usually **dynamic** and **evolving**
- ▶ Complex networks can be social, economic, natural, informational, abstract, ...

Properties

Some key features of real complex networks:

- ▶ Degree distribution
 - ▶ Assortativity
 - ▶ Homophily
 - ▶ Clustering
 - ▶ Motifs
 - ▶ Modularity
 - ▶ Concurrency
 - ▶ Hierarchical scaling
 - ▶ Network distances
 - ▶ Centrality
 - ▶ Efficiency
 - ▶ Robustness
- ▶ Coevolution of network structure and processes on networks.

Properties

1. Degree distribution P_k

- ▶ P_k is the probability that a randomly selected node has degree k
- ▶ **Big deal:** Form of P_k key to network's behavior
- ▶ **ex 1:** Erdős-Rényi random networks have a Poisson distribution:

$$P_k = e^{-\langle k \rangle} \langle k \rangle^k / k!$$
- ▶ **ex 2:** "Scale-free" networks: $P_k \propto k^{-\gamma} \Rightarrow$ 'hubs'
- ▶ We'll come back to this business soon...

A notable feature of large-scale networks:

- ▶ Graphical renderings are often just a big mess.

← Typical hairball

- ▶ number of nodes $N = 500$
- ▶ number of edges $m = 1000$
- ▶ average degree $\langle k \rangle = 4$

- ▶ And even when renderings somehow look good: "That is a very graphic analogy which aids understanding wonderfully while being, strictly speaking, wrong in every possible way" said Ponder [Stibbons] — *Making Money*, T. Pratchett.
- ▶ We need to extract **digestible, meaningful aspects**.

- Basic definitions
- Examples of Complex Networks
- Properties of Complex Networks
- Nutshell
- Basic models of complex networks
- Generalized random networks
- Scale-free networks
- Small-world networks
- Generalized affiliation networks
- References

Properties

2. Assortativity/3. Homophily:

- ▶ **Social networks:** **Homophily** (田) = birds of a feather
- ▶ e.g., degree is standard property for sorting: measure degree-degree correlations.
- ▶ **Assortative network:** [20] similar degree nodes connecting to each other.
 - ▶ Often **social**: company directors, coauthors, actors.
- ▶ **Disassortative network:** high degree nodes connecting to low degree nodes.
 - ▶ Often **technological or biological**: Internet, protein interactions, neural networks, food webs.

- Examples of Complex Networks
- Properties of Complex Networks
- Nutshell
- Basic models of complex networks
- Generalized random networks
- Scale-free networks
- Small-world networks
- Generalized affiliation networks
- References

Properties

4. Clustering:

- ▶ Your friends tend to know each other.
- ▶ Two measures:

$$C_1 = \left\langle \frac{\sum_{h,j,k \in \mathcal{N}_i} a_{hjk}}{k_i(k_i - 1)/2} \right\rangle_i \text{ due to Watts \& Strogatz [31]}$$

$$C_2 = \frac{3 \times \text{\#triangles}}{\text{\#triples}} \text{ due to Newman [21]}$$

- ▶ C_1 is the **average fraction** of **pairs of neighbors** who are **connected**.
- ▶ Interpret C_2 as probability two of a node's friends know each other.

- Properties of Complex Networks
- Nutshell
- Basic models of complex networks
- Generalized random networks
- Scale-free networks
- Small-world networks
- Generalized affiliation networks
- References

Properties

7. Concurrency:

- ▶ Transmission of a contagious element only occurs during contact [18]
- ▶ Rather obvious but easily missed in a simple model
- ▶ Dynamic property—static networks are not enough
- ▶ Knowledge of previous contacts crucial
- ▶ **Beware** cumulated network data!

- References

Properties

8. Horton-Strahler stream ordering:

- ▶ Metrics for branching networks:
 - ▶ Method for ordering streams hierarchically
 - ▶ Reveals fractal nature of natural branching networks
 - ▶ Hierarchy is not pure but mixed (Tokunaga). [26, 12]
 - ▶ Major examples: rivers and blood networks.

- ▶ **Beautifully described** but **poorly explained**.

Properties

9. Network distances:

- (a) **shortest path length d_{ij}** :
 - ▶ Fewest number of steps between nodes i and j .
 - ▶ (Also called the chemical distance between i and j .)
- (b) **average path length $\langle d_{ij} \rangle$** :
 - ▶ Average shortest path length in whole network.
 - ▶ Good algorithms exist for calculation.
 - ▶ Weighted links can be accommodated.

Properties

9. Network distances:

(c) Network diameter d_{\max} :

- ▶ Maximum shortest path length in network.

(d) Closeness $d_{c1} = [\sum_{ij} d_{ij}^{-1} / \binom{n}{2}]^{-1}$:

- ▶ Average 'distance' between any two nodes.
- ▶ Closeness handles disconnected networks ($d_{ij} = \infty$)
- ▶ $d_{c1} = \infty$ only when all nodes are isolated.

Nutshell:

Overview Key Points (cont.):

- ▶ Obvious connections with the vast extant field of graph theory.
- ▶ But focus on dynamics is more of a physics/stat-mech/comp-sci flavor.
- ▶ Two main areas of focus:
 1. **Description:** Characterizing very large networks
 2. **Explanation:** Micro story \Rightarrow Macro features
- ▶ Some essential structural aspects are understood: degree distribution, clustering, assortativity, group structure, overall structure,...
- ▶ Still much work to be done, especially with respect to dynamics...

Properties

10. Centrality:

- ▶ Many such measures of a node's 'importance.'
- ▶ **ex 1:** Degree centrality: k_i .
- ▶ **ex 2:** Node i 's betweenness = fraction of shortest paths that pass through i .
- ▶ **ex 3:** Edge ℓ 's betweenness = fraction of shortest paths that travel along ℓ .
- ▶ **ex 4:** Recursive centrality: Hubs and Authorities (Jon Kleinberg^[17])

Nutshell:

Overview Key Points:

- ▶ The field of complex networks came into existence in the late 1990s.
- ▶ Explosion of papers and interest since 1998/99.
- ▶ Hardened up much thinking about complex systems.
- ▶ Specific focus on networks that are **large-scale**, **sparse**, **natural** or **man-made**, **evolving** and **dynamic**, and (crucially) **measurable**.
- ▶ Three main (blurred) categories:
 1. **Physical** (e.g., river networks),
 2. **Interactional** (e.g., social networks),
 3. **Abstract** (e.g., thesauri).

Models

Generalized random networks:

- ▶ Arbitrary degree distribution P_k .
- ▶ Create (unconnected) nodes with degrees sampled from P_k .
- ▶ Wire nodes together randomly.
- ▶ Create ensemble to test deviations from randomness.

Building random networks: Stubs

Phase 1:

- ▶ **Idea:** start with a soup of unconnected nodes with **stubs** (half-edges):

- ▶ Randomly select stubs (not nodes!) and connect them.
- ▶ Must have an even number of stubs.
- ▶ Initially allow **self-** and **repeat** connections.

Sampling random networks

Phase 2:

- ▶ Use rewiring algorithm to remove all self and repeat loops.

Phase 3:

- ▶ **Randomize network** wiring by applying rewiring algorithm liberally.
- ▶ **Rule of thumb:** # Rewirings $\approx 10 \times \# \text{ edges}$ [19].

Building random networks: First rewiring

Phase 2:

- ▶ Now find any (A) self-loops and (B) repeat edges and **randomly rewire** them.

- ▶ **Being careful:** we can't change the degree of any node, so we can't simply move links around.
- ▶ **Simplest solution:** randomly rewire **two edges** at a time.

Scale-free networks

- ▶ Networks with power-law degree distributions have become known as **scale-free** networks.
- ▶ Scale-free refers specifically to the **degree distribution** having a **power-law decay** in its tail:

$$P_k \sim k^{-\gamma} \text{ for 'large' } k$$

- ▶ One of the seminal works in complex networks: Laszlo Barabási and Reka Albert, Science, 1999: "Emergence of scaling in random networks" [4]
- ▶ Somewhat misleading nomenclature...

General random rewiring algorithm

- ▶ Randomly choose **two edges**. (Or choose problem edge and a random edge)
- ▶ Check to make sure edges are **disjoint**.
- ▶ Rewire one end of each edge.
- ▶ Node degrees **do not change**.
- ▶ Works if e_1 is a self-loop or repeated edge.
- ▶ Same as finding on/off/on/off 4-cycles. and rotating them.

BA model

- ▶ **Definition:** A_k is the attachment kernel for a node with degree k .
- ▶ For the original model:

$$A_k = k$$

- ▶ **Definition:** $P_{\text{attach}}(k, t)$ is the attachment probability.
- ▶ For the original model:

$$P_{\text{attach}}(\text{node } i, t) = \frac{k_i(t)}{\sum_{j=1}^{N(t)} k_j(t)} = \frac{k_i(t)}{\sum_{k=0}^{k_{\max}(t)} k N_k(t)}$$

where $N(t) = m_0 + t$ is # nodes at time t and $N_k(t)$ is # degree k nodes at time t .

Scale-free networks

The big deal:

- ▶ We move beyond describing networks to finding **mechanisms** for why certain networks are the way they are.

A big deal for scale-free networks:

- ▶ How does the exponent γ depend on the mechanism?
- ▶ Do the mechanism details matter?

Approximate analysis

- ▶ When $(N + 1)$ th node is added, the expected increase in the degree of node i is

$$E(k_{i,N+1} - k_{i,N}) \simeq m \frac{k_{i,N}}{\sum_{j=1}^{N(t)} k_j(t)}$$

- ▶ Assumes probability of being connected to is **small**.
- ▶ Dispense with Expectation by assuming (hoping) that over longer time frames, degree growth will be smooth and stable.
- ▶ Approximate $k_{i,N+1} - k_{i,N}$ with $\frac{d}{dt} k_{i,t}$:

$$\frac{d}{dt} k_{i,t} = m \frac{k_i(t)}{\sum_{j=1}^{N(t)} k_j(t)}$$

where $t = N(t) - m_0$.

BA model

- ▶ Barabási-Albert model = BA model.
- ▶ Key ingredients: **Growth** and **Preferential Attachment (PA)**.
- ▶ **Step 1:** start with m_0 disconnected nodes.
- ▶ **Step 2:**
 1. **Growth**—a new node appears at each time step $t = 0, 1, 2, \dots$
 2. Each new node makes m links to nodes already present.
 3. **Preferential attachment**—Probability of connecting to i th node is $\propto k_i$.
- ▶ In essence, we have a **rich-gets-richer** scheme.

Overview of Complex Networks

- Basic definitions
- Examples of Complex Networks
- Properties of Complex Networks
- Nutshell
- Basic models of complex networks
 - Generalized random networks
 - Scale-free networks
 - Small-world networks
 - Generalized affiliation networks
- References

Approximate analysis

- ▶ Deal with denominator: each added node brings m new edges.

$$\therefore \sum_{j=1}^{N(t)} k_j(t) = 2tm$$

- ▶ The node degree equation now simplifies:

$$\frac{d}{dt} k_{i,t} = m \frac{k_i(t)}{\sum_{j=1}^{N(t)} k_j(t)} = m \frac{k_i(t)}{2mt} = \frac{1}{2t} k_i(t)$$

- ▶ Rearrange and solve:

$$\frac{dk_i(t)}{k_i(t)} = \frac{dt}{2t} \Rightarrow k_i(t) = c_i t^{1/2}$$

- ▶ Next find $c_i \dots$

Overview of Complex Networks

- Basic definitions
- Examples of Complex Networks
- Properties of Complex Networks
- Nutshell
- Basic models of complex networks
 - Generalized random networks
 - Scale-free networks
 - Small-world networks
 - Generalized affiliation networks
- References

Approximate analysis

- ▶ Know i th node appears at time

$$t_{i,\text{start}} = \begin{cases} i - m_0 & \text{for } i > m_0 \\ 0 & \text{for } i \leq m_0 \end{cases}$$

- ▶ So for $i > m_0$ (exclude initial nodes), we must have

$$k_i(t) = m \left(\frac{t}{t_{i,\text{start}}} \right)^{1/2} \text{ for } t \geq t_{i,\text{start}}.$$

- ▶ All node degrees grow as $t^{1/2}$ but later nodes have larger $t_{i,\text{start}}$ which flattens out growth curve.
- ▶ Early nodes do **best** (First-mover advantage).

Degree distribution

- ▶ So what's the **degree distribution** at time t ?
- ▶ Use fact that birth time for added nodes is distributed uniformly:

$$\Pr(t_{i,\text{start}})dt_{i,\text{start}} \simeq \frac{dt_{i,\text{start}}}{t}$$

- ▶ Also use

$$k_i(t) = m \left(\frac{t}{t_{i,\text{start}}} \right)^{1/2} \Rightarrow t_{i,\text{start}} = \frac{m^2 t}{k_i(t)^2}.$$

Transform variables—Jacobian:

$$\frac{dt_{i,\text{start}}}{dk_i} = -2 \frac{m^2 t}{k_i(t)^3}.$$

Preferential attachment through randomness

- ▶ Instead of attaching preferentially, allow new nodes to attach randomly.
- ▶ Now add an **extra step**: new nodes then connect to some of their friends' friends.
- ▶ Can also do this **at random**.
- ▶ Assuming the existing network is random, we know probability of a **random friend** having degree k is

$$Q_k \propto kP_k$$

- ▶ So **rich-gets-richer** scheme can now be seen to work in a natural way.

Things to do and questions

- ▶ Vary attachment kernel.
- ▶ Vary mechanisms:
 1. Add edge deletion
 2. Add node deletion
 3. Add edge rewiring
- ▶ Deal with directed versus undirected networks.
- ▶ **Important Q.:** Are there distinct universality classes for these networks?
- ▶ **Q.:** How does changing the model affect γ ?
- ▶ **Q.:** Do we need preferential attachment and growth?
- ▶ **Q.:** Do model details matter?
- ▶ The answer is (surprisingly) **yes**. See Simon's model of Zipf.

Preferential attachment

- ▶ Let's look at preferential attachment (**PA**) a little more closely.
- ▶ PA implies arriving nodes have **complete knowledge** of the existing network's degree distribution.
- ▶ For example: If $P_{attach}(k) \propto k$, we need to determine the constant of proportionality.
- ▶ We need to know what everyone's degree is...
- ▶ PA is \therefore an **outrageous** assumption of node capability.
- ▶ But a **very simple mechanism** saves the day...

Robustness

- ▶ Scale-free networks are thus **robust to random failures** yet **fragile to targeted ones**.
- ▶ All very reasonable: **Hubs** are a big deal.
- ▶ **But:** next issue is whether hubs are vulnerable or not.
- ▶ Representing all webpages as the same size node is obviously a stretch (e.g., google vs. a random person's webpage)
- ▶ Most connected nodes are either:
 1. Physically larger nodes that may be harder to 'target'
 2. or subnetworks of smaller, normal-sized nodes.
- ▶ Need to explore cost of various targeting schemes.

Small-world networks

Introduced by Watts and Strogatz (Nature, 1998) [31]
 "Collective dynamics of 'small-world' networks."

Small-world networks were found everywhere:

- ▶ neural network of C. elegans,
- ▶ semantic networks of languages,
- ▶ actor collaboration graph,
- ▶ food webs,
- ▶ social networks of comic book characters,...

Very weak requirements:

- ▶ local regularity + random short cuts

Toy model:

Previous work—finding short paths

- ▶ What can a local search method reasonably use?
- ▶ How to find things without a map?
- ▶ Need some measure of distance between friends and the target.

Some possible knowledge:

- ▶ Target's identity
- ▶ Friends' popularity
- ▶ Friends' identities
- ▶ Where message has been

The structural small-world property:

- ▶ $L(p)$ = average shortest path length as a function of p
- ▶ $C(p)$ = average clustering as a function of p

Previous work—finding short paths

Jon Kleinberg (Nature, 2000) [16]
 "Navigation in a small world."

Allowed to vary:

1. local search algorithm and
2. network structure.

Previous work—finding short paths

Kleinberg's Network:

1. Start with regular d-dimensional cubic lattice.
2. Add local links so nodes know all nodes within a distance q .
3. Add m short cuts per node.
4. Connect i to j with probability

$$p_{ij} \propto x_{ij}^{-\alpha}$$

- ▶ $\alpha = 0$: random connections.
- ▶ α large: reinforce local connections.
- ▶ $\alpha = d$: connections grow logarithmically in space.

The problem

If there are no hubs and no underlying lattice, how can search be efficient?

Which friend of a is closest to the target b ?

What does 'closest' mean?

What is 'social distance'?

Overview of Complex Networks

Previous work—finding short paths

Theoretical optimal search:

- ▶ "Greedy" algorithm.
- ▶ Number of connections grow logarithmically (slowly) in space: $\alpha = d$.
- ▶ Social golf.

Search time grows slowly with system size (like $\log^2 N$).

But: social networks aren't lattices plus links.

Models

One approach: incorporate identity.

Identity is formed from attributes such as:

- ▶ Geographic location
- ▶ Type of employment
- ▶ Religious beliefs
- ▶ Recreational activities.

Groups are formed by people with at least one similar attribute.

Attributes \Leftrightarrow Contexts \Leftrightarrow Interactions \Leftrightarrow Networks.

Previous work—finding short paths

- ▶ If networks have hubs can also search well: Adamic et al. (2001)^[1]

$$P(k_i) \propto k_i^{-\gamma}$$

where k = degree of node i (number of friends).

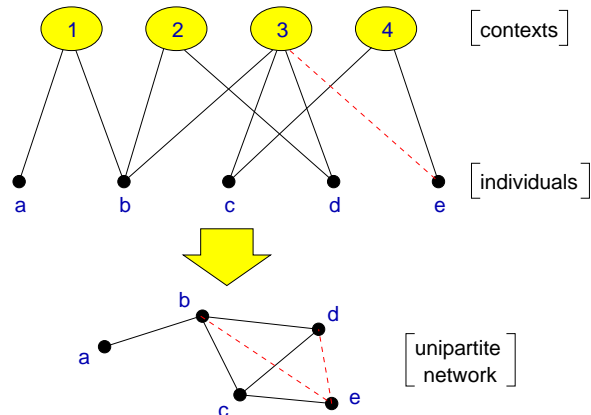

- ▶ Basic idea: get to hubs first (airline networks).
- ▶ But: hubs in social networks are limited.

Models

Distance between two individuals x_{ij} is the height of lowest common ancestor.

$x_{ij} = 3, x_{ik} = 1, x_{iv} = 4.$

The model

$\vec{v}_i = [1 \ 1 \ 1]^T, \vec{v}_j = [8 \ 4 \ 1]^T$
 $x_{ij}^1 = 4, x_{ij}^2 = 3, x_{ij}^3 = 1.$

Social distance:
 $y_{ij} = \min_h x_{ij}^h.$

Models

- Individuals are more likely to know each other the closer they are within a hierarchy.
- Construct z connections for each node using

$p_{ij} = c \exp\{-\alpha x_{ij}\}.$

- $\alpha = 0$: random connections.
- α large: local connections.

The model—results—searchable networks

q = probability an arbitrary message chain reaches a target.

- ▶ A few dimensions help.
- ▶ Searchability decreases as population increases.
- ▶ Precise form of hierarchy largely doesn't matter.

The model—results

Milgram's Nebraska-Boston data:

Model parameters:

- ▶ $N = 10^8$,
- ▶ $z = 300, g = 100$,
- ▶ $b = 10$,
- ▶ $\alpha = 1, H = 2$;
- ▶ $\langle L_{\text{model}} \rangle \approx 6.7$
- ▶ $L_{\text{data}} \approx 6.5$

Nutshell for Small-World Networks:

- ▶ Bare networks are typically unsearchable.
- ▶ Paths are findable if nodes understand how network is formed.
- ▶ Importance of identity (interaction contexts).
- ▶ Improved social network models.
- ▶ Construction of peer-to-peer networks.
- ▶ Construction of searchable information databases.
