Social contagion

Optimism according to Ambrose Bierce: (⊞)

The doctrine that everything is beautiful, including what is ugly, everything good, especially the bad, and everything right that is wrong. ... It is hereditary, but fortunately not contagious.

Introduction

Social contagion

Eric Hoffer, 1902-1983

There is a grandeur in the uniformity of the mass. When a fashion, a dance, a song, a slogan or a joke sweeps like wildfire from one end of the continent to the other, and a hundred million people roar with laughter, sway their bodies in unison, hum one song or break forth in anger and denunciation, there is the overpowering feeling that in this country we have come nearer the brotherhood of man than ever before.

► Hoffer (⊞) was an interesting fellow...

Hoffer's acclaimed work: "The True Believer:

Thoughts On The Nature Of Mass Movements" (1951)^[8]

"We can be absolutely certain only about things we

"Mass movements can rise and spread without belief

"Where freedom is real, equality is the passion of the

masses. Where equality is real, freedom is the

in a God, but never without belief in a devil."

The spread of fanaticism

do not understand."

passion of a small minority."

Imitation

despair.com

"When people are free to do as they please, they usually imitate each other."

-Eric Hoffer "The Passionate State of Mind"^[9]

Examples of non-disease spreading:

Interesting infections:

► Spreading of buildings in the US... (⊞)

► Viral get-out-the-vote video. (⊞)

Contagion

Definitions

- (1) The spreading of a quality or quantity between individuals in a population.
- (2) A disease itself: the plague, a blight, the dreaded lurgi, ...
- from Latin: con = 'together with' + tangere 'to touch.'
- Contagion has unpleasant overtones...
- Just Spreading might be a more neutral word
- But contagion is kind of exciting...

Mathematical Epidemiology

The standard SIR model [14]

- = basic model of disease contagion
- Three states:
 - 1. S = Susceptible
 - 2. I = Infective/Infectious
- 3. R = Recovered or Removed or Refractory
- ► S(t) + I(t) + R(t) = 1
- Presumes random interactions (mass-action principle)
- Interactions are independent (no memory)
- Discrete and continuous time versions

Discrete time automata example:

Transition Probabilities:

 β for being infected given contact with infected r for recovery ρ for loss of immunity

References

Background Predicting s

Independent Interaction models

Reproduction Number R_0 :

- R₀ = expected number of infected individuals resulting from a single initial infective
- Epidemic threshold: If $R_0 > 1$, 'epidemic' occurs.

 $\frac{\mathrm{d}}{\mathrm{d}t}S = -\beta IS + \rho R$

 $\frac{\mathrm{d}}{\mathrm{d}t}I = \beta IS - rI$

• 𝔍 𝔍 𝔄 15 of 68

Reproduction Number R_0

Discrete version:

- Set up: One Infective in a randomly mixing population of Susceptibles
- At time t = 0, single infective random bumps into a Susceptible
- Probability of transmission = β
- At time t = 1, single Infective remains infected with probability 1 - r
- At time t = k, single Infective remains infected with probability $(1 - r)^k$

Biological Contagion

Introduction

Simple disease

spreading models

Differential equations for continuous model Simple disease spreading models

Reproduction Number R_0

Discrete version:

Expected number infected by original Infective:

$$R_0 = \beta + (1-r)\beta + (1-r)^2\beta + (1-r)^3\beta + \dots$$

$$= \beta \left(1 + (1 - r) + (1 - r)^2 + (1 - r)^3 + \dots \right)$$
$$= \beta \frac{1}{1 - (1 - r)} = \frac{\beta}{r}$$

For S_0 initial infectives $(1 - S_0 = R_0 \text{ immune})$:

$$R_0 = S_0 \beta / r$$

Independent Interaction models

For the continuous version

Second equation:

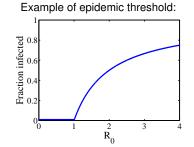

$$\frac{\mathrm{d}}{\mathrm{d}t}I = \beta SI - rI$$
$$\frac{\mathrm{d}}{\mathrm{d}t}I = (\beta S - r)I$$

Number of infectives grows initially if

$$\beta S(0) - r > 0 \Rightarrow \beta S(0) > r \Rightarrow \beta S(0)/r > 1$$

Same story as for discrete model.

Independent Interaction models

- Continuous phase transition.
- ► Fine idea from a simple model.

Predicting social catastrophe References

Simple disease spreading models

Independent Interaction models

Many variants of the SIR model:

- SIS: susceptible-infective-susceptible
- ► SIRS: susceptible-infective-recovered-susceptible
- compartment models (age or gender partitions)
- more categories such as 'exposed' (SEIRS)
- recruitment (migration, birth)

Disease spreading models

R_0 approximately same for all of the following: $\blacktriangleright\,$ 1918-19 "Spanish Flu" \sim 500,000 deaths in US

1957-58 "Asian Flu" ~ 70.000 deaths in US

2. How important is the reproduction number R_0 ?

1. Can we predict the size of an epidemic?

- 1968-69 "Hong Kong Flu" ~ 34,000 deaths in US
- $\blacktriangleright\,$ 2003 "SARS Epidemic" \sim 800 deaths world-wide

Size distributions

Simple disease spreading models Background Predicting so

References

UNIVERSITY

わくで 22 of 68

Size distributions are important elsewhere:

- earthquakes (Gutenberg-Richter law)
- city sizes, forest fires, war fatalities
- wealth distributions
- 'popularity' (books, music, websites, ideas)
- Epidemics?

Power laws distributions are common but not obligatory...

Really, what about epidemics?

- Simply hasn't attracted much attention.
- Data not as clean as for other phenomena.

Measured values of γ :

- measles: 1.40 (low Ψ) and 1.13 (high Ψ)
- pertussis: 1.39 (low Ψ) and 1.16 (high Ψ)
- Expect $2 \le \gamma < 3$ (finite mean, infinite variance)
- When $\gamma < 1$, can't normalize
- ► Distribution is quite flat.

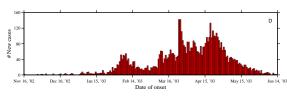

Biological Contagion

UNIVERSITY うへで 30 of 68

Biological Contagion

Resurgence—example of SARS

- ► Epidemic slows... then an infective moves to a new context.
- Epidemic discovers new 'pools' of susceptibles: Resurgence.
- Importance of rare, stochastic events.

The challenge

- So... can a simple model produce
- 1. broad epidemic distributions and
- 2. resurgence ?

Introduction Simple disea spreading models References

Introduction Simple disease spreading models Prediction

References

Biological Contagion

Size distributions

- random, small-world, scale-free, ...
- Exceptions:
 - 1. Forest fire models
 - 2. Sophisticated metapopulation models

Burning through the population

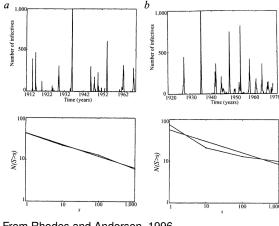

Forest fire models: [15]

- Rhodes & Anderson, 1996
- The physicist's approach: "if it works for magnets, it'll work for people..."

A bit of a stretch:

- 1. Epidemics \equiv forest fires spreading on 3-d and 5-d lattices.
- 2. Claim Iceland and Faroe Islands exhibit power law distributions for outbreaks.
- 3. Original forest fire model not completely understood.

Size distributions

From Rhodes and Anderson, 1996.

Model output

Define P₀ = Expected number of infected individuals leaving initially infected context.

- Need $P_0 > 1$ for disease to spread (independent of $R_0).$
- Limit epidemic size by restricting frequency of travel and/or range

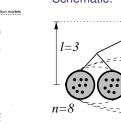

Biological

Contagion

Introduction

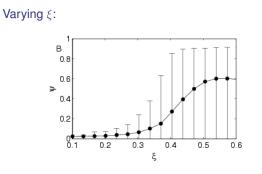

VERMONT

わ < へ 43 of 68

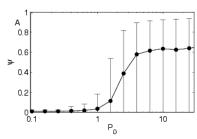

Model output

 Transition in expected final size based on typical movement distance (sensible)

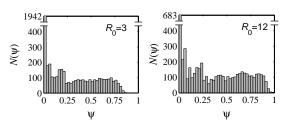

Model output

Varying P₀:

- Transition in expected final size based on typical number of infectives leaving first group (also sensible)
- Travel advisories: ξ has larger effect than P_0 .

Example model output: size distributions

- Flat distributions are possible for certain ξ and *P*.
- Different R₀'s may produce similar distributions
- ▶ Same epidemic sizes may arise from different R₀'s

Conclusions

Biological Contagion

Introduction

Prediction More models Toy metapop

Conclusions

References

Simple disease spreading models

- For this model, epidemic size is highly unpredictable
- Model is more complicated than SIR but still simple
- We haven't even included normal social responses such as travel bans and self-quarantine.
- The reproduction number R_0 is not terribly useful.
- \triangleright R₀, however measured, is not informative about 1. how likely the observed epidemic size was, 2. and how likely future epidemics will be.
- Problem: R₀ summarises one epidemic after the fact and enfolds movement, the price of bananas, everything.

Conclusions

- Disease spread highly sensitive to population structure
- ► Rare events may matter enormously (e.g., an infected individual taking an international flight)
- More support for controlling population movement (e.g., travel advisories, quarantine)

Biological Contagion

Conclusions

What to do:

- Need to separate movement from disease
- ► R₀ needs a friend or two.
- Need $R_0 > 1$ and $P_0 > 1$ and ξ sufficiently large for disease to have a chance of spreading

More wondering:

- Exactly how important are rare events in disease spreading?
- Again, what is N?

Predicting social catastrophe isn't easy...

"Greenspan Concedes Error on Regulation"

- ... humbled Mr. Greenspan admitted that he had put too much faith in the self-correcting power of free markets ...
- "Those of us who have looked to the self-interest of lending institutions to protect shareholders' equity, myself included, are in a state of shocked disbelief"
- Rep. Henry A. Waxman: "Do you feel that your ideology pushed you to make decisions that you wish you had not made?"
- Mr. Greenspan conceded: "Yes, I've found a flaw. I don't know how significant or permanent it is. But I've been very distressed by that fact."

New York Times, October 23, 2008 (⊞)

Economics, Schmeconomics

Alan Greenspan (September 18, 2007):

"I've been dealing with these big mathematical models of forecasting the economy ...

If I could figure out a way to determine whether or not people are more fearful or changing to more euphoric,

I don't need any of this other stuff.

I could forecast the economy better than http://wikipedia.org any way I know."

Economics, Schmeconomics

Greenspan continues:

"The trouble is that we can't figure that out. I've been in the forecasting business for 50 years. I'm no better than I ever was, and nobody else is. Forecasting 50 years ago was as good or as bad as it is today. And the reason is that human nature hasn't changed. We can't improve ourselves."

Jon Stewart:

"You just bummed the @*!# out of me."

- ▶ From the Daily Show (⊞) (September 18, 2007)
- ▶ The full inteview is here (\boxplus) .

Economics, Schmeconomics

James K. Galbraith:

- NYT But there are at least 15,000 professional economists in this country, and you're saying only two or three of them foresaw the mortgage crisis? [JKG] Ten or 12 would be closer than two or three.
- NYT What does that say about the field of economics, which claims to be a science? [JKG] It's an enormous blot on the reputation of the profession. There are thousands of economists. Most of them teach. And most of them teach a theoretical framework that has been shown to be fundamentally useless.
